

Weekly Economic Review

Alberta economy to slow substantially in 2015

Alberta Economic Outlook

Oil investment weighs on growth

The Government of Alberta expects real GDP growth to slow to 0.4% in 2015 and 1.7% in 2016, before rebounding to around 3% in the medium term (Chart 1). This is a sharp slowdown from 3-4% growth over the previous 5 years. The economy will be weighed down by a 30% decline in oil and gas investment in 2015 brought on by the sharp decline in oil prices. WTI is expected to average around US\$55/bbl in fiscal year 2015-16, thereafter rising gradually to over US\$80/bbl in 2019-20. GDP will be supported by continued growth in export volumes and household spending.

For more details, please see the [Economic Outlook in Budget 2015](#).

Metres Drilled for Oil and Gas

Drilling sinks in January

The number of metres drilled for oil and gas in Alberta in January decreased 26% from a year ago, the lowest January total since 2010 (Chart 2). The decrease was due to a 50% fall in oil metres, with metres drilled for conventional crude oil declining 54% and metres drilled for bitumen falling 34%. This more-than-offset a 24% increase in natural gas drilling. Metres drilled per well continued to increase, up 34% y/y. This is the result of increased use of horizontal drilling techniques, which are now being employed on 66% of wells, up from 62% a year ago.

Refined Products

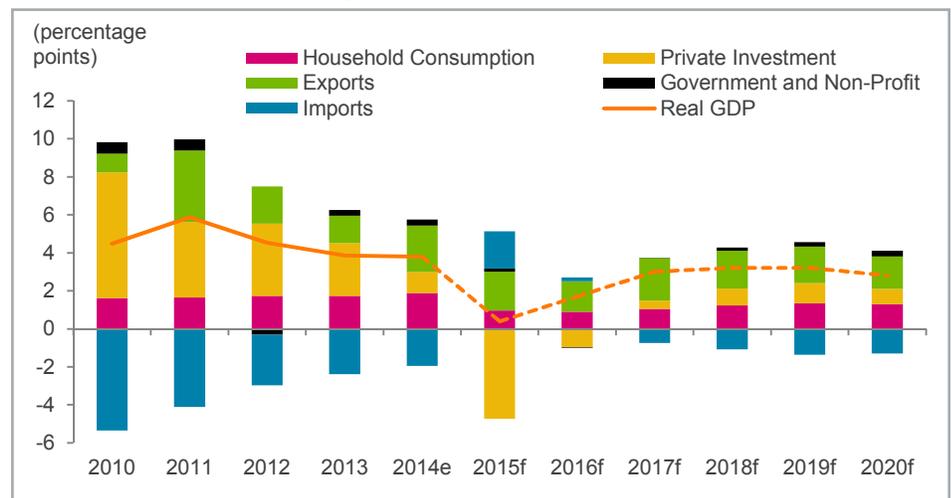

Production continues to increase

Production of final refined petroleum products in Alberta increased by 2.1% y/y in December 2014. Growth was driven by a 6.6% increase in gasoline production, as well as a 22% reduction

in refinery losses. Diesel production was effectively unchanged from a year ago. Annual refinery production in 2014 was 4.5% higher than in 2013, led by diesel production, which increased 12.4%. Gasoline production in 2014 increased by 6.1%. Diesel production made up 42% of total refinery output; gasoline made up 38%.

Railway Car Loadings

Crude shipments slow

The number of railcars loaded in Western Canada increased by 4.0% y/y in January, an increase of 5,700 cars. The number of cars carrying crude oil nearly tripled between 2011 and 2013, but have since flattened out. They were up just 3.3% from January 2014. This was the lowest year-over-year increase since June 2011. The greatest contributors to the increase in car loadings were potash (+19%), fresh, chilled, and dried vegetables (+90%) and canola (+12%). These increases helped offset a 20% decrease in the number of cars carrying coal (Chart 3).

Employment Insurance

More claims in January

The number of initial employment insurance (EI) claims received in January rose to 23,340, up 26% from a year ago, the largest year-over-year increase since the 2008-09 recession. In total, there were 30,960 EI beneficiaries in Alberta, a 2.4% increase from December and the fourth-straight monthly increase (Chart 4). There were 10,850 EI beneficiaries in Edmonton, an increase of 3.6% from December. Calgary had 9,810 EI beneficiaries, an increase of 0.9%.

Across Canada there were 496,640 EI beneficiaries in January, up slightly from December, but down 2.8% y/y. Among the provinces, Newfoundland and Labrador had the largest monthly increase in beneficiaries at 2.7%, followed by Alberta. Almost all provinces posted year-over-year declines except for Quebec (+2.0% y/y) and Alberta.

US Housing Market

Housing starts drop

US housing starts dropped sharply in February, falling 17% to the lowest level in over a year, as harsh winter weather slowed building. This did not seem to hurt sales, however, as both existing and new home sales increased in February. Existing home sales rose for a fifth-consecutive month, up 1.2% over January, while new home sales hit a 7-year high, spiking by 7.8%. The impressive growth in new home sales mostly stemmed from the North East, where sales were up over 150% from January. Since February 2014, existing homes sales have risen by 4.7% and new home sales have increased by 25%.
