Meningococcal Conjugate (Groups A, C, Y and W-135) Vaccine (MenC-ACYW)
Revision Date: May 4, 2018

Please consult the Product Monograph¹ for further information about the vaccine.

Indications for use of provincially funded vaccine

Pre-exposure:
- Students in Grade 9 – routine program in Alberta.

Notes:
- Students should receive the vaccine regardless of previous meningococcal immunization received in a routine infant/preschool program.⁴
- Students, who are eligible in Grade 9 (starting in 2010-2011 school-year) but did not receive the vaccine, continue to be eligible to receive this vaccine up to the end of Grade 12 if they present to public health.
- Laboratory workers routinely exposed to Neisseria meningitides,⁴ if they are involved in conducting subculture identification, susceptibility testing, serological and/or molecular characterization and deep freeze for storage. Laboratory workers who do only initial specimen plants are not eligible.
- Individuals at high risk of invasive meningococcal disease (IMD) due to underlying medical conditions as listed (see Menveo® for at risk children younger than 24 months of age):
  - Asplenia - anatomical or functional (including sickle-cell disease).²
  - Acquired complement deficiency due to receipt of the terminal complement inhibitor eculizumab (Soliris®).⁴
    Note: Individuals prescribed eculizumab (Soliris®) should receive meningococcal vaccine at least two weeks before receiving the first dose of Soliris®⁴ if possible.
  - Congenital complement, properdin, factor D or primary antibody deficiencies.⁴
  - Hematopoietic stem cell transplant (HSCT) recipients. See:
    - Immunization for Child Hematopoietic Stem Cell Transplant Recipients
    - Immunization for Adult Hematopoietic Stem Cell Transplant Recipients.
- HIV infection especially if it is congenitally acquired.\(^4\)
- Solid organ transplant candidates and recipients. See:
  - Immunization for Children Expecting Solid Organ Transplant at 18 Months of Age or Older (Catch-up Schedule) and
  - Immunization for Adult Solid Organ Transplant Candidates and Recipients.

**Note:** For additional information see: Immunization of Specific Populations.

### Post-exposure:
- **Close contacts** and/or outbreak control when serogroups A, Y or W-135 are identified.\(^4\)

**Notes:**
- Results of the index case serogroup should be known before proceeding with immunization.
- Contacts of meningococcal serogroup C who are eligible for meningococcal conjugate quadrivalent vaccine (MenC-ACYW) e.g., students in Grade 9, 10, 11 or 12 who have not already received their adolescent MenC-ACYW vaccine, should receive MenC-ACYW not meningococcal conjugate C vaccine (MenconC).
- Other contacts of meningococcal serogroup C. See Biological Products - Meningococcal Conjugate C Vaccine.
- Contacts of meningococcal serogroup B see Meningococcal B Multicomponent Recombinant Vaccine - BEXSERO®.

For disease information, contact assessment, chemoprophylaxis and reporting guidelines, refer to Public Health Notifiable Disease Management Guidelines – Meningococcal Disease, Invasive\(^6\)

### Schedule

#### Pre-exposure:
- **Grade 9 students – routine**
  - 1 dose
  
  **Note:** Students who have previously received MenC-ACYW (e.g., for travel or close contact of IMD):
  - If MenC-ACYW vaccine was received when younger than 12 years of age, offer the vaccine in Grade 9.
  - If MenC-ACYW vaccine was received at 12 years of age or older, the vaccine is not indicated in Grade 9.

- **Eligible laboratory workers**
  - 1 dose (booster doses every five years as long as risk continues).\(^4\)

- **Individuals at high risk of IMD due to underlying medical conditions:**
  - **2 months – 11 months of age (use Menveo® only)**
    - Dose 1: 2 months of age
    - Dose 2: 4 months of age
    - Dose 3: 6 months of age
    - Dose 4: 12 months of age (and at least eight weeks after 3rd dose).\(^1,4\)
### Meningococcal Conjugate (Groups A, C, Y and W-135) Vaccine

#### Notes:
- The first dose should not be administered before eight weeks of age.\(^4\)
- Booster dose three years after the last dose (12 – 23 months of age) followed by every five years as long as risk continues.\(^4\)
- Meningococcal conjugate C vaccine (MenconC) is not recommended in addition to Menveo® for infants and children at high risk for IMD.\(^4\)

- **12 months – 23 months of age (use Menveo® only)**
  - Two doses administered eight weeks apart.\(^4\)
  - Booster dose three years after the 2\(^{nd}\) dose followed by every five years as long as risk continues.\(^4\)

- **Two years of age and older:**
  - Two doses administered eight weeks apart.\(^2,7\)
  - Booster doses every 3-5 years:
    - Six years of age and younger at time of initial immunization: *administer a booster dose three years after the last dose followed by a booster dose every five years.*\(^4\)
    - Seven years of age and older at time of initial immunization: *administer a booster dose every five years.*\(^4\)

#### Post-exposure (contacts of A, Y and W-135)

- **2 months – 11 months of age (use Menveo® only)**
  - Unimmunized: 3 doses administered eight weeks apart with another dose between 12 and 23 months of age and at least eight weeks from the previous dose.\(^4\)
  - Previous immunization MenconC: administer Menveo® series as for unimmunized regardless of when the last dose of MenconC was administered.\(^4\)
  - Previous immunization with MenC-ACYW: administer one dose of Menveo® if at least four weeks after a previous dose and complete the series.\(^4\)

- **12 months – 23 months of age (use Menveo® only)**
  - Unimmunized: Two doses of Menveo® with an interval of at least eight weeks between the doses.\(^4\)
  - Previously immunized with MenconC, administer two doses of Menveo® with an interval of at least eight weeks between the doses regardless of when the previous dose of MenconC was administered.\(^4\)

</table>

#### Contraindications
- Known severe hypersensitivity to any component of the vaccine.
- Anaphylactic or other allergic reactions to a previous dose of vaccine containing meningococcal conjugate vaccine.

#### Precautions
- Will not protect against infections caused by organisms other than serogroups A, C, Y and W-135 *N. meningitidis*.

**Note:** NACI now recommends that Menactra® or Menveo® may be administered to people with a previous history of Guillain-Barré Syndrome (GBS).7

A previous history of GBS is not a contraindication to receiving Nimenrix®.

#### Possible reactions
- See Product Monograph

#### Pregnancy
- Conjugate meningococcal vaccines have not been studied in pregnant women; however, in specific situations as outlined above the vaccine should be administered when indicated.1,2,3,4

#### Lactation
- Breastfeeding women should receive vaccine if indicated.4

#### Program Notes
- 2011 February - Meningococcal Conjugate (A, C, Y, W-135) routine school immunization program for Grade 9 students.
- 2012 January 26 - Meningococcal Conjugate (A, C, Y, W-135) for individuals at high risk 56 years of age and older.
- 2015 February 10 – Menactra®/Menveo® updated indication for individuals with acquired complement deficiency on Solaris®
- 2017 September - Nimenrix® Meningococcal Conjugate (A, C, Y, W-135) was introduced into immunization program

#### Historical Notes:
- 2001 February 6 – 2002 March 1 - Meningococcal Polysaccharide Bivalent A, C (Outbreak campaign for individuals 2-24 years of age)
