# Measles-Mumps-Rubella-Varicella Combined Vaccine (MMR-Var)

**Revision Date:** April 10, 2018

**Rationale for update:** Updated NACI recommendations for varicella proof of immunity. Verbal history is not a reliable indicator of immunity in populations where varicella vaccine has been introduced.

Please consult the Product Monograph\(^1,2\) for further information about the vaccine.

<tr>
<td><strong>Schedule</strong></td>
<td>Children 12 months of age up to and including 12 years of age:&lt;br&gt;  • Dose 1: 12 months of age&lt;br&gt;  • Dose 2: 4 – 6 years of age</td>
<td></td>
</tr>
</tbody>
</table>
Notes:

• The recommended interval between two doses is at least three months, however a six-week interval can be used if rapid protection is required.1

• If a univalent varicella vaccine, was administered as the first dose of varicella vaccine, an interval of at least three months should separate the first dose (univalent vaccine) from the second dose (MMR-Var).3

• Any dose of MMR or MMR-Var vaccine administered before one year of age must be repeated after 12 months of age.

• Parents who refuse the combined vaccine and wish to have the vaccines as separate components (MMR and univalent varicella vaccines) may be accommodated.

• Children who received a single dose of varicella-containing vaccine and developed laboratory-confirmed varicella disease do not require the second dose of varicella-containing vaccine.3

• Children traveling to areas where measles is circulating in North America (Canada, USA and Mexico) and all countries outside of North America should have two doses of measles-containing vaccine with the appropriate minimum interval between doses dependent upon the measles-containing vaccine used.5,6

Spacing between MMR-Var and Yellow Fever vaccine

Recent limited data suggest it may be preferable for children aged 12-23 months of age to receive MMR-containing and YF vaccine at least 30 days apart if time permits, because of lower seroconversion rates for mumps, rubella, and yellow fever in those immunized simultaneously than in those immunized 30 days apart. The study did not include infants younger than 12 months of age, but it is reasonable to follow the same guidance for infants under 12 months of age.7,8

Contraindications

• Known hypersensitivity to any component of the vaccine.1,2

• Anaphylactic reaction to a previous dose of vaccine containing measles, mumps, rubella and/or varicella.

• Pregnancy.

• Impaired immune function including those with primary or secondary immunodeficiencies.1,2,3

• HIV-infected children.3 See MMR vaccines and univalent varicella vaccines.

• Immunosuppressive therapy (including high dose corticosteroids).1,2

• Family history of congenital or hereditary immunodeficiency, unless the immune competence of the potential vaccine recipient is demonstrated.3

• Active untreated tuberculosis.

• Hematopoietic stem cell transplant recipients. See MMR vaccines, univalent varicella vaccines and see Immunization for Child Hematopoietic Stem Cell Recipients.

• Solid organ transplant recipients: See:
  - Immunization for Children Expecting Solid Organ Transplant before 18 Months of Age and
  - Immunization for Children Expecting Solid Organ Transplant after 18 Months of Age (Catch-up and Ongoing).

• Recent (within the past 11 months) administration of immune globulins and blood products. The interval between the receipt of IG or a blood product and the subsequent MMR-Var administration is dependent upon the IG or blood product received and the dosage administered.
Refer to Contraindications and Precautions to Immunization – Guidelines for Interval between Blood Products and Live Vaccines. See also Canadian Immunization Guide – Blood products, human immune globulin and timing of immunization.

### Precautions

- Immunization of children with a history of febrile convulsions or a family history of convulsions, or a history of cerebral injury should be considered with caution.\(^1,2\) Children immunized with MMR-Var should be closely monitored as vaccine-related fever may occur during the period ranging from 5 – 12 days after immunization.\(^1,2\)

- There is an increased risk of fever and febrile convulsions 5 – 12 days after the first dose of MMR-Var vaccine in children 12 to 23 months of age as compared with two separate injections of MMR and varicella vaccines.\(^1,2,9\) There is no indication of an increased risk after the second dose.\(^1,2\)

- Egg allergy is not a contraindication to immunization with MMR-Var vaccine.\(^1,2\) See Contraindications and Precautions to Immunization

- Immunization with a measles-containing vaccine can temporarily suppress tuberculin reactivity resulting in false-negative results.\(^3\) If tuberculin skin testing is required, it should be done on the same day as immunization with a measles-containing vaccine or delayed for at least four weeks after immunization.\(^3\)

- The use of MMR-Var vaccine in children who suffered thrombocytopenia after a first dose of live measles, mumps, and rubella vaccines should be carefully evaluated in terms of risk-benefit.\(^1,2\) Individuals who develop vaccine-associated thrombocytopenia should have serology to assess immunity to measles, mumps and rubella.\(^10\) A second dose of vaccine should only be administered if non-immune and after careful consideration of the risks and benefits of the vaccine.

- Avoid the use of salicylates for six weeks after immunization if possible.\(^1,2\) Because adverse events have not been reported with the use of salicylates after varicella immunization, children with conditions requiring chronic salicylate therapy should be considered for immunization with close subsequent monitoring.\(^3\) Medical consultation is recommended before proceeding with immunization for children on salicylate therapy.

- Children taking long-term antiviral therapy should discontinue these drugs (e.g., acyclovir, valacyclovir or famciclovir) if possible from at least 24 hours before administration of varicella-containing vaccine and should not restart antiviral therapy until 14 days after immunization.\(^3\) Medical consultation is recommended before proceeding with immunization.

- If a vaccine recipient develops a varicella-like rash, the rash should be covered\(^3\) and direct contact with susceptible high-risk individuals (e.g., immunocompromised individuals) should be avoided for the duration of the rash.\(^3,11\)

- Live attenuated influenza vaccine (LAIV) may be administered any time before or after the administration of live parenteral vaccines (MMR, MMR-Var and VZ).

<th>Possible reactions</th>
<th>Common Reactions: (^1,2)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- Pain, redness and swelling at the injection site.</td>
</tr>
<tr>
<td></td>
<td>- Measles-like rash, rubella-like rash, varicella-like rash</td>
</tr>
<tr>
<td></td>
<td>- Irritability</td>
</tr>
<tr>
<td></td>
<td>- Fever- higher incidence (approximately 1.5 fold) of fever was observed after the first dose when compared to the concomitant administration of MMR and Varicella vaccines at separate sites.</td>
</tr>
<tr>
<td></td>
<td>- Diarrhea, vomiting</td>
</tr>
</tbody>
</table>
Uncommon Reactions:

- Lymphadenopathy, parotid gland enlargement, lethargy, malaise, fatigue, anorexia, decreased appetite, crying, insomnia, nervousness, rhinitis
- Gastroenteritis
- Ear infection/otitis, nasopharyngitis, pharyngitis
- Febrile convulsions

Rare:

- Otitis media, seizures, cough, bronchitis
- Allergic reactions and anaphylaxis

Additional adverse events following immunization reported through post-marketing surveillance include:

- Thrombocytopenia; vasculitis (including Henoch Schonlein purpura and Kawasaki syndrome); meningitis; orchitis; epididymitis; arthralgia/arthritis; encephalitis; cerebrovascular accident; cerebellitis; cerebellitis-like symptoms (including transient gait disturbance and transient ataxia); erythema multiforme, cellulitis, parotitis, aplastic anemia, Bell’s palsy, encephalitis/encephalopathy, acute disseminated encephalomyelitis (ADEM), Guillain-Barré syndrome (GBS), paraesthesia, polyneuritis, transverse myelitis, subacute sclerosing panencephalitis, aseptic meningitis, myalgia, Stevens-Johnson syndrome, ophthalmologic conditions, bronchial spasm, bronchitis, epistaxis, hematochezia, mouth ulcer, erythema multiforme, purpura, pruritus.

Refer to Adverse Events Following Immunization (AEFI), Policy for Alberta Immunization Providers.

Pregnancy

Pregnancy should rarely be an issue as MMR-Var vaccine is recommended only for children younger than 13 years of age. However, MMR-Var vaccine is contraindicated if pregnant and pregnancy should be avoided for at least one month following immunization.

Lactation

Adequate human data on the use of MMR-Var vaccine during breastfeeding is not available.
