GENERAL

1	Provide an update on any project design changes, and their impacts, which have occurred since the filing of the application.
---	--

Response

There have been no material changes to the Project design since the Application was filed. Engineering of the Project has continued since filing which includes refinements to the site layout and tankage. Changes to the Project schedule, site layout and gasification are described below.

Delay of 2 years in the Construction Schedule

The Project's peak construction is expected in 2014, after the cumulative peak projected for 2012. Furthermore, the delay will allow for a gradual ramp up of the Upgrader operations workforce. This delay in the employment is anticipated to more evenly spread out the projected population effects on the RSA. This in turn will likely translate into delayed and lower effects on the regional infrastructure and social services when compared to the effects of the schedule filed in December 2007. In summary, the schedule shift is not expected to change the conclusions regarding the Project impacts but will likely delay and lower some cumulative impacts

Changes to the Site Layout

Changes have been made to the site layout since the Application was filed to optimize equipment location, reduce capital cost and improve site logistics. A revised site plan is provided in [Figure 1-1](#).

Updates to the site plan since the Application was filed include:

- **Relocation of the Steam Methane Reformer (SMR)** from the utility area to the main process area to optimize the layout of the hydrogen system. The SMR is a major steam producer; its relocation also positions the unit closer to the steam users.
- **A larger tank farm area** is proposed for the east side of Range Road 212. StatoilHydro has increased the overall Upgrader storage capacity by about 10%. Tank spacing was also modified, increasing the overall footprint of the tank farm. This change to the tank farm required relocation of the gasification facilities to the west side of Range Road 212. Revised tankage information is presented in [Table 1-1](#).
- **Relocation of the hydrocarbon flares to a central location** to reduce capital cost and improve operational efficiency between the two hydrocarbon flares.
- **Relocation of the sulphur recovery units** to move this emission source further away from the fenceline. The relocation will also reduce the capital cost of

constructing steam jacketed piping from the north end of the facility to the sulphur forming facility at the south end. The new configuration also improves amine integration with the gas recovery units which will be the largest users of amine.

- **Relocation and resizing of the raw water ponds** based on updated engineering data.

Addition of the Pressure Swing Adsorption (PSA) Tail Gas Steam Boiler for Gasification 1

It was stated in the Application that the Gasification 1 Pressure Swing Adsorption (PSA) tail gas stream would be blended into the overall fuel gas system for the Upgrader; however, the PSA tail gas stream has a low heating value and variations in fuel gas heat content can decrease the stability of the heaters using the fuel gas. To reduce the potential for heater instability, the PSA tail gas will be combusted in a separate boiler that will generate high pressure steam for electrical power production in the gasification unit or for export to other units.

[SIR Response 7](#) provides the tail gas boiler emissions profile.

Untreated Gasoil	1 x 39,746 1 x 15,898	1 x 39,746 1 x 15,898 1 x 9,538	VFRT	0.04
Synthetic Crude	3 x 19,078	4 x 19,078	VFRT	Maximized to 2.5 % butane specification
Light Slop	1 x 6,359	2 x 6,359	IFRT	36
Heavy Slop	1 x 4,769	2 x 4,769	IFRT	0.04
High Vapour Pressure Slop (reject sphere)	1 x 2,385	1 x 2, 385	n/a	>36
Butane (sphere)	2 x 1,590	4 x 1,590	n/a	n/a
Propane	3 x 954	6 x 954	n/a	n/a

Notes:

- 1 There are no underground storage tanks
- 2 Tank type abbreviations:
IFRT – Internal floating roof tank
VFRT – Vertical fixed roof tank
- 3 Vapour pressure is at standard conditions, 15 degrees C and 101.3 kPa (a)

2	Provide an update on any public consultation activities which have occurred since the filing of the application.
	a. What activities have been undertaken?
	b. What issues have been raised?
	c. What issues have been resolved and how (itemize all commitments)?
	d. What issues remain outstanding and how will they be resolved (itemize all commitments)?
	e. What joint industry efforts have been made to resolve public concerns?

Response

- a. StatoilHydro has conducted ongoing public consultation since 2006. The application, submitted December, 2007 contained information regarding consultation efforts undertaken up to October 31, 2007. This section provides a summary of the consultation efforts undertaken from November 1, 2007 to July 31, 2008.

StatoilHydro has continued to consult with:

- landowners, occupants and surrounding communities;
- government;
- special interest and non-governmental organizations;
- Aboriginals; and,
- others.

The stakeholder list was expanded as additional stakeholders were identified.

Communities

Landowners and occupants in the LSEA and surrounding communities have been consulted through a number of different methods as described in [Table 2-1](#).

Table 2-1 Community Consultation

Consultation Method	Date	Description
Direct contact	On-going	Direct contact occurred with over 30 landowners in the LSEA in which the Project was discussed
Open houses	April 30, 2008	StatoilHydro hosted an open house in Bruderheim, Alberta. 200 individuals registered for the open house. StatoilHydro staff were available to answer questions regarding to the Project. Three landowners requested sampling of their water wells.
	May 1, 2008	StatoilHydro hosted an open house in Josephburg, Alberta. 93 individuals registered for the open house. StatoilHydro staff were available to answer questions regarding to the Project.

Consultation Method	Date	Description
Trade shows	January 8, 2008	StatoilHydro participated in the Nordic Trade Fair in Sherwood Park, Alberta where attendees could view information ask StatoilHydro staff questions regarding the Project.
	April 18-20, 2008	StatoilHydro participated in the Fort Saskatchewan Trade Fair in Fort Saskatchewan, Alberta. The Project was discussed with over 200 individuals and several individuals were added to the stakeholder list.
Community events	February 8, 2008	StatoilHydro hosted a community dinner in Josephburg, Alberta. 120 stakeholders registered for the dinner and the attendees had an opportunity to discuss the Project with StatoilHydro staff.
	June 8, 2008	StatoilHydro hosted a community picnic at the project office on the Upgrader site. Approximately 150 individuals attended the event and had an opportunity to discuss the Project with StatoilHydro staff.
	June 11, 2008	A StatoilHydro staff member volunteered at the Josephburg Agricultural Society's Social function and was available to discuss the Project with attendees.

Government

Consultation occurred with a number of government organizations. [Table 2-2](#) provides a listing of the government consultation that occurred between November 1, 2007, and July 31, 2008.

Table 2-2 Government Consultation

Government Organization	Date	Topic
Elk Island Public Schools	March 6, 2008	Gave a general presentation on the Project to Elk Island Public Schools.
Alberta Environment	March 14, 2008	Discussion on Project water supply and water intake.
City of Edmonton	March 28, 2008 and May 9, 2008	Discussed Project worker accommodation.
Strathcona County	May 20, 2008	Presented a Project update and the updated schedule to council.
City of Fort Saskatchewan	May 20, 2008	Presented a Project update and the updated schedule to council.
Town of Bruderheim	May 21, 2008	Presented a Project update and the updated schedule to council.
Lamont County	June 3, 2008	Presented a Project update and the updated schedule to council.
Strathcona County	June 27, 2008	Participated in and provided input to the Josephburg airport strategy meeting regarding StatoilHydro's projected use of the Josephburg airport.

Special Interest Groups and Non-Governmental Organizations (NGOs)

Table 2-3 presents the consultation that occurred with special interest groups and NGOs between November 1, 2007 and July 31, 2008.

Table 2-3 Special Interest Group and NGO Consultation

Group Name	Date	Topic
Small informal landowner group	January 24, 2008	Concerned that there will not be enough funds in the voluntary property purchase program (VPPP).
Alberta's Industrial Heartland Land Trust Society	May 15, 2008	Discussed the Project timelines at the society's annual general meeting.

Industry Organizations

StatoilHydro continues to be involved with the industry and multi-stakeholder organizations listed in [Volume 1, Section 10.4.5](#) and outlined in [Part 2e](#).

Industry and Business Stakeholder Consultation

Consultation with other industry in the area is ongoing through StatoilHydro's participation in the organizations listed in [Volume 1, Section 10.4.5](#). Between November 1, 2007, and July 31, 2008, additional businesses that have been consulted with include:

- Bunge Canada;
- Cathcart Homes;
- Willow Ridge Construction;
- Horizon North; and
- Greenview Developments

Aboriginal Consultation

Direct contact with the Alexander First Nation occurred on June 25, 2008 and a follow up meeting is being scheduled for fall 2008.

Other Consultation

On May 22, 2008, StatoilHydro discussed the Project at the Scotford-Astotin Residents Joint Community meeting. This semi-annual meeting is designed to give industry an opportunity to provide other stakeholders (general public, industry and government) with information on their current and future operations.

- b. Two new issues have been raised since the Application was filed.

1. A residents' group is concerned that there are not enough funds in the VPPP to accommodate the number of residents that they believe will be moving out of the area.

The Alberta's Industrial Heartland (AIH) Land Trust Society states that:

"The VPPP, administered under Alberta's Industrial Heartland Land Trust Society, is one of several initiatives developed as a result of collaborative efforts among resident, industry and municipal representatives to give area residents an opportunity to sell their residential property at a fair price and receive reasonable compensation for expenses they would incur to move out of the policy area.

The VPP Program was initiated by Alberta's Industrial Heartland Association and several local companies in 2004 to find fair and practical ways to address long-standing resident concerns about the cumulative impact of industrial activity and development in the Heartland policy area" (Alberta's Industrial Heartland Land Trust Society, 2007).

The VPPP is funded by neighbouring counties and industry members that operate within the AIH. StatoilHydro is a member company of the Land Trust Society and is committed to contributing to the VPPP through their agreement with the AIH. StatoilHydro will be involved in upcoming workshops with the Land Trust Society where the capital contribution formula will be reviewed. As stated in the application, StatoilHydro is committed to providing funding to the VPPP and working with the Land Trust Society to help ensure the long-term sustainability of the VPPP.

2. The second new issue is the request from three landowners to sample their water wells. This request has been agreed to by StatoilHydro.
- c. Both new issues currently remain outstanding.
 - d. The following strategies are in place to resolve the two issues described in the response to Part 2b above.
 1. StatoilHydro is committed to work with Alberta's Industrial Heartland Land Trust Society on resolving the issues with the issues around capitalization
 2. StatoilHydro will work with the landowners requesting water well testing.

Of the many other commitments made by StatoilHydro, much progress has been made on resolving them however at this time none are complete. All commitments have been prioritized and plans to resolve them are in place or being developed.

- e. Since November 2007, StatoilHydro has participated in numerous working groups and committees focusing on water, air, traffic and consultation within the AIH Area. StatoilHydro is a member of the Northeast Capital Industrial Association (NCIA) and has worked with Alberta Environment to develop the Water Management Framework

for the Capital Region and the AIH. StatoilHydro is currently participating in the implementation of Phase 1 of this Framework.

StatoilHydro has been involved in the Industrial Air Management Area (IAMA) working group and has attended numerous meetings since its inception in October of 2007.

StatoilHydro has attended NCIA Upgrader Subcommittee meetings and the Traffic Working Group meeting.

StatoilHydro participated in the Heartland Transmission Line Advisory Panel which is developing a consultation strategy for power line routing in the AIH.

StatoilHydro has recently joined the Northeast Community Awareness and Emergency Response (NRCAER) group, which will provide support and information to StatoilHydro and the public in the event of an emergency.

<http://www.ihcari.com/pdf/VPPPSuccessPressReleaseFeb.2007.pdf>

3	Provide a response to the issues raised in the Statements of Concern which have been filed with Alberta Environment.
---	--

Response

Auriga Energy Inc. (Auriga) submitted a letter to the Energy Resources Conservation Board on May 28, 2008. StatoilHydro was copied on that letter. Auriga has four subsurface leases that are accessed from land owned by StatoilHydro and has raised concerns regarding the development of these mineral leases.

StatoilHydro is currently negotiating a tri-party agreement between StatoilHydro, Auriga and SunWest Canada Energy Ltd. concerning each party's proposed developments. SunWest holds tenure on salt caverns under the StatoilHydro leases. StatoilHydro activities will not effect SunWest's operations and they have not submitted a Statement of Concern with respect to the Project.

StatoilHydro received ten Statements of Concern on July 22, 2008, from Alberta Environment. These Statements of Concern are from local landowners whose concerns are primarily related to Health and Safety, Air Pollution, Water, Economic, Social and Planning, and Regulatory Process. StatoilHydro is reviewing these Statements of Concern and is developing responses to address concerns identified by local landowners.

TECHNICAL

4	Volume 2, Section 2.6.1.2, Page 2-22 <i>Statoil states Operations will be managed to control the duration and frequency of major upset flaring events. A detailed flare management plan will be prepared after commissioning to reflect actual operating conditions. Mitigation features will include limiting duration and adding supplementary natural gas.</i>
	a. Confirm that Statoil will commit to meeting all the applicable requirements of ERCB Directive 060.

Response

Energy Resources Conservation Board (ERCB) Directive 060 provides information pertaining to flaring, venting or incinerating from *upstream* petroleum and from gas transmission facilities. It is StatoilHydro's understanding that the Upgrader is considered to be a downstream facility and therefore Directive 060 is not directly applicable. Notwithstanding this status, the guidance provided in Directive 060 is considered to represent industry best practice and, as stated in [Volume 1, Section 8.2](#), a flare management plan consistent with ERCB's Directive 060 will be developed. The flare management plan will be developed once detailed design engineering has been completed. Furthermore, any venting or incinerating from the Project will be done in accordance with all applicable legislation.

5	<p>Volume 1, Sections 3.3.3 and 4.1.4, Table 4.1-3, Figure 3.3-2, Pages 23 and 44 <i>The project natural gas demand for hydrogen production in Table 4.1-3 does not match that shown in Figure 3.3-2.</i></p> <p>a. Clarify the apparent discrepancy in reported natural gas demand for hydrogen production and provide revised tables/figures as appropriate.</p>
---	--

Response

- a. Natural gas demand is related primarily to the hydrogen supply from the Steam Methane Reformer (SMR). The hydrogen requirement for the Project case is 330,170 Nm³/h. The hydrogen supply from Gasification 1 is 245,000 Nm³/h. Therefore, the hydrogen supply from the SMR for the Project is 85,170 Nm³/h or 81.8% of the Phase 1 capacity. The natural gas requirement for hydrogen production for the Project is 35,420 Nm³/h.

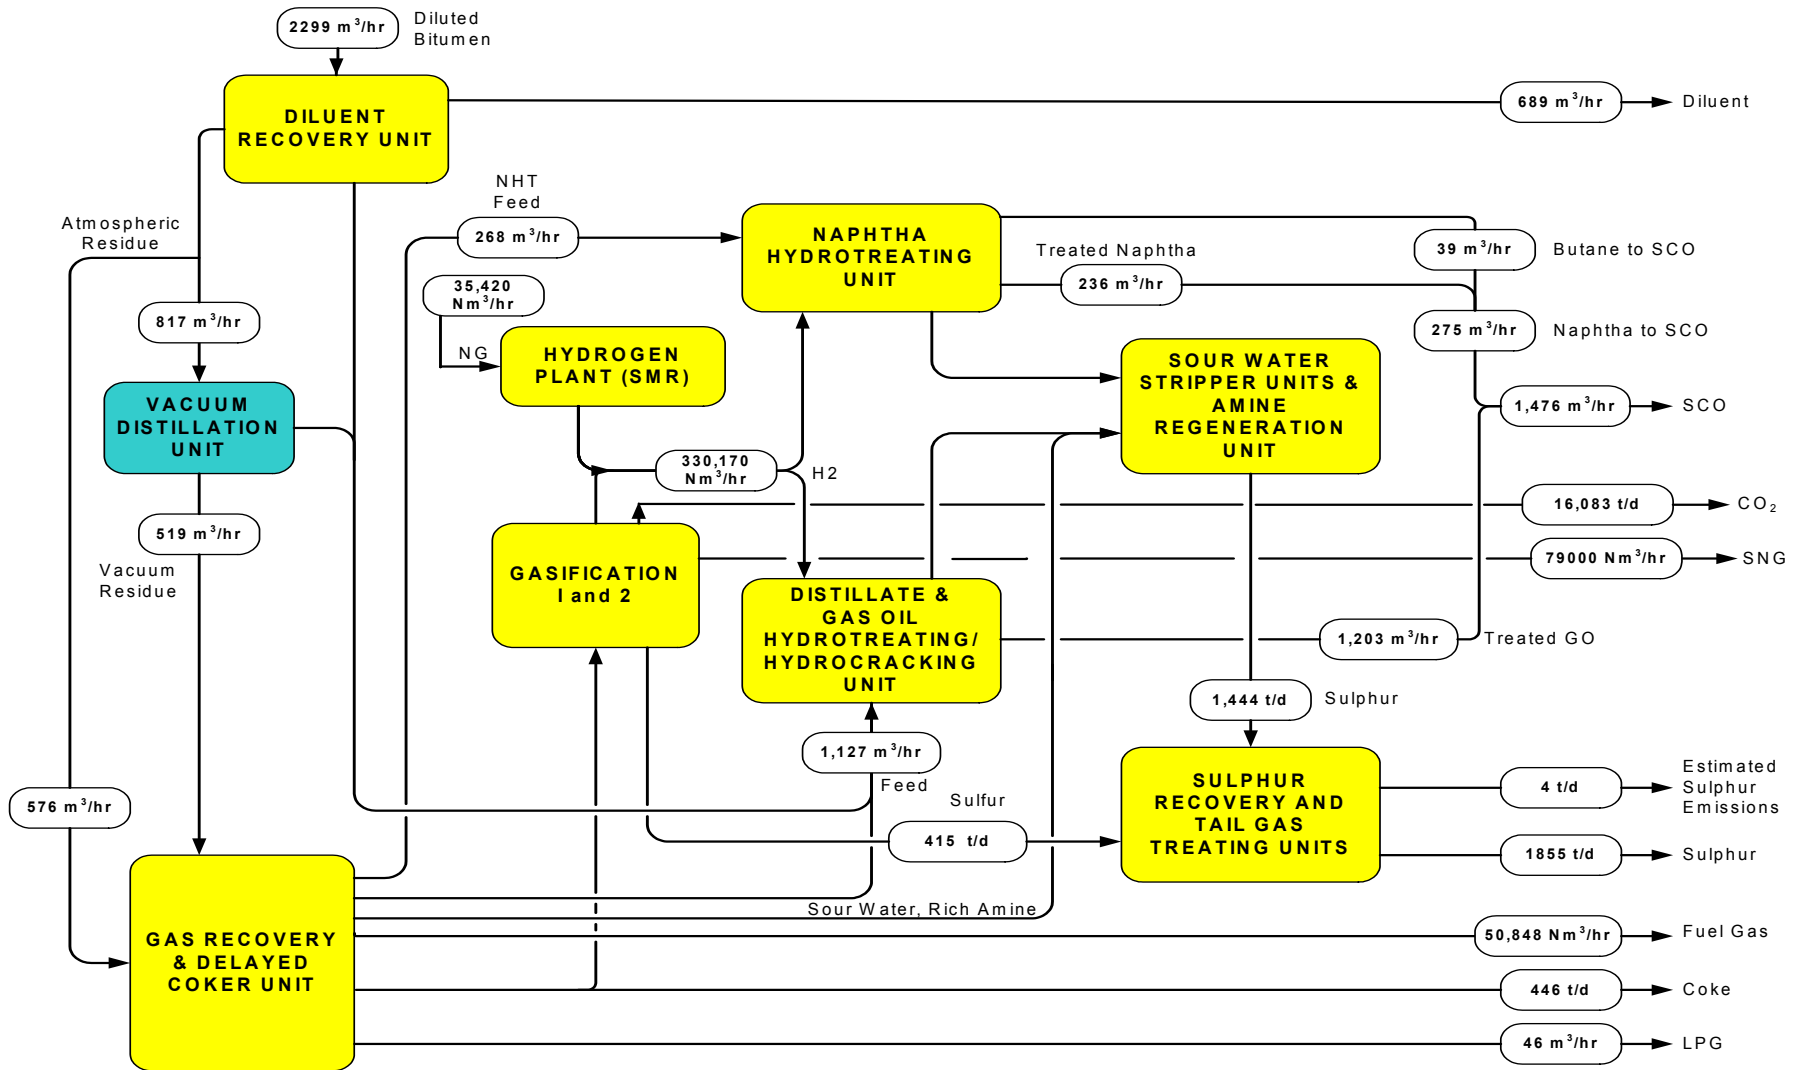

Table 5-1 (Table 4.1-3 Revised) and Figure 5-1 (Figure 3.3-2 Revised) follow.

Table 5-1 (Table 4.1-3 Revised) Natural Gas Consumption

Process Unit	Normal Heat Fired (GJ/h)		Natural Gas Demand (Nm ³ /h)	
	Phase 1	The Project	Phase 1	The Project
Diluent Recovery	270	730	355	961
Delayed Coker	488	1,076	642	1,416
Vacuum Unit	-	207	-	272
Naphtha Hydrotreater	13	27	17	36
Distillate Hydrotreater	57	57	75	75
Gas Oil Hydrotreater	-	56	-	74
Vacuum Gas Oil Hydrocracker	-	40	-	53
Hydrogen Plant ¹	104	87	-	-
Hydrogen Production ²	-	-	43,301	35,420
Flare Stacks	-	-	140	327
Gasification Units	--	-	--	69
Utility Boilers ³	272	403	358	530
Total	1,204	2,683	44,888	39,233

Notes:

- 1 Natural gas used as fuel in the hydrogen plant reformer furnace. Duty shown is for fuel gas make-up consumption only. The balance of its fuel consumption is PSA tailgas.
- 2 Natural gas requirement as feedstock for hydrogen production.
- 3 Utility boilers' heat duty has been derived from the steam generation required to balance the process, tankage and steam tracing. Two boilers are expected to be in service at 50% capacity for Phase 1, three boilers for the Project.

Title:
FIGURE 5-1
PROCESS FLOW DIAGRAM
(REVISED)

StatoilHydro

Approved: DR	Revision Date: July 20/08
File: Figure 5-1 The Project Process Flow Diagram.doc	
Drawn by: BF	Checked: BE

6	<p>Volume 1, Sections 3.5.1.7 and 3.5.2.8, Tables 3.5-2 and 3.5-7, Pages 30 and 35 Clarify the information presented in Tables 3.5-2 and 3.5-7. The coker fuel gas stream represents only the volume flow of H₂S, not the entire fuel gas stream, whereas the remaining streams represent the entire volume of the stream and not only the volume of H₂S. Assuming this is the case, how do these streams compare with those presented in Figures 3.3-1 and 3.3-2?</p>
---	---

Response

In Tables 6-1 and 6-2, the entire coker fuel gas stream is shown. In Volume 1, Tables 3.5-2 and 3.5-7, this coker fuel gas stream includes the hydrocarbons in the C₄ range (C₄s) and the liquid petroleum hydrocarbons (LPG) to simplify the sulphur balance. In Volume 1, Section 3, Figures 3.3-1 and 3.3-2, the LPG is broken out of the fuel gas as C₄s to naphtha and C₃s to LPG.

There was a discrepancy in the fuel gas conversion to Nm³/h in Volume 1, Figures 3.3-1 and 3.3-2. The correct numbers are shown in Tables 6-1 and 6-2.

Table 6-1 (Table 3.5-2 Revised) Phase I Sulphur Extraction Estimate

Phase 1	Table 3.5-2		Figure 3.3-1	Comments
	Flow	Sulphur wt %		
Coker Fuel Gas	43,759 kg/h	17.96	20,778 Nm ³ /h	Revised from 16,804 Nm ³ /h
Coker Naptha	94 m ³ /h	1.649	108 m ³ /h	Figure 3.3-1 includes 14 m ³ /h C ₄ s
Light Coker Gas Oil	121 m ³ /h	2.796	264 m ³ /h	-
Heavy Coker Gas Oil	143 m ³ /h	4.503		
Light Gas Oil	78 m ³ /h	1.663	78 m ³ /h	
LPG	nil	-	17 m ³ /h	LPG (C ₃ s) and C ₄ s included in Table 3.5-2 Coker Fuel Gas

Table 6-2 (Table 3.5-7 Revised) Project Sulphur Extraction Estimate

The Project	Table 3.5-7		Figure 3.3-2	Comments
	Flow	Sulphur wt %		
Coker Fuel Gas	87,365 kg/h	24.20	50,848 Nm ³ /h	Revised from 42,492 Nm ³ /h
Coker Naptha VR	115 m ³ /h	2.02	268 m ³ /h	Figure 3.3-2 includes 35 m ³ /h C ₄ s
Coker Naptha AR	118 m ³ /h	1.65		
Light Coker Gas Oil VR	141 m ³ /h	3.53	1127 m ³ /h	-
Light Coker Gas Oil AR	152 m ³ /h	2.80		
Heavy Coker Gas Oil VR	118 m ³ /h	5.46		
Heavy Coker Gas Oil AR	180 m ³ /h	4.50		
Light Gas Oil	238 m ³ /h	1.66		
VGO	293 m ³ /h	3.25		
LPG	nil	-	46 m ³ /h	LPG (C ₃ s) and C ₄ s included in Table 3.5-7 Coker Fuel Gas

7	<p>Volume 1, Sections 3.5.3.7 and 4.2.1.2, Table 4.2-2, Pages 38 and 45 Statoil states that the tail gas from the Pressure Swing Adsorption (PSA) unit, which contains CO, CO₂, and H₂, is routed to the upgrader fuel gas system. However, the composition of the fuel gas in Table 4.2-2 does not reflect the noted compounds. Clarify.</p>
---	---

Response

It was stated in Volume 1 that the Gasification 1 Pressure Swing Adsorption (PSA) tail gas stream would be blended into the overall fuel gas system for the Upgrader. However, the PSA tail gas stream has a low heating value and variations in fuel gas heat content can decrease the stability of the heaters using the fuel gas. To reduce the potential for heater instability, the PSA tail gas will be combusted in a separate boiler that will generate high pressure steam for electrical power production in the gasification unit or for export to other units.

Table 7-1 provides PSA tail gas boiler stack parameters.

Table 7-1 Gasification 1 PSA Tail Gas Boiler Stack Parameters

Source identification #		Gasification 1
Unit Identification #		193

8	Volume 1, Sections 3.1 and 4.2.5, Pages 17 and 50 Statoil indicates that its project will consist of four hydrocarbon flares, five acid gas flares, and two low pressure flares. However, Figure 3.1-1 shows only six flares in total. Clarify and update the Figure as appropriate.
---	--

Response

[Figure 3.1-1 \(Application Volume 1, page 22\)](#) shows the six standalone flares:

- two hydrocarbon flares for the Upgrader;
- two hydrocarbon flares for the Gasification units; and
- two low pressure flares for the tank farms.

The five acid gas flares will be located alongside the five tail gas treating unit (TGTU) incinerator stacks. In the Application, a note at the bottom of [Table 4.2-9 \(Volume 1, page 51\)](#) indicated that the five acid gas flares would be attached to the TGTU incinerator stacks.

9	<p>Volume 1, Section 4.4, Page 61</p> <p>Statoil states <i>Light hydrocarbon material generated during unit start-ups and shut-downs will require isolation in off-specification storage (reject system). From time to time, the production may also be diverted to the reject system. Heavier, more stable material will be stored in atmospheric tanks. Lighter material (with Reid Vapour Pressure (RVP) greater than 12 psi) or odorous streams will be stored in a pressurized sphere. The sphere will be connected to the low pressure flare. Any lighter material will be diverted to the sphere on start-up until it is determined to meet specifications for atmospheric tank storage.</i></p>
	a. Quantify the volume of material that Statoil expects to flare on an annual basis from the <i>reject system</i> .
	b. Characterize the compounds which will be sent to the <i>reject system</i> , in particular any sulphurous compounds.
	c. Clarify how these flaring events have been accounted for in the project's emissions inventory.

Response

- a. No flaring is expected from the reject system. For safety reasons, the reject sphere will be connected to the low pressure flare; however, the reject sphere will also be connected to the Gas Recovery Unit (GRU). The GRU has been designed with sufficient capacity to reprocess any material from the reject sphere that does not meet specifications.
- b. The reject system in question will contain mostly aliphatic C₂ to C₆ material. Other compounds that would most likely be found in this system include, H₂S, the mercaptan group, 1-3 butadiene, the thiophene group, CS₂ and COS. A list of the possible compounds that could be found in this system is given in [Table 9-1](#).

Table 9-1 Possible Compounds Found in the Reject Sphere

Compounds		
1,3-Butadiene	C ₅ -C ₈ aliphatic group	Mercaptan group
Aliphatic alcohols	C ₉ -C ₁₆ aliphatic group	Methane
Aliphatic ketones	C ₉ -C ₁₆ aromatic group	Naphthalene
Acenaphthene	Ethylbenzene	Phenanthrene
Anthracene	Fluorene	C ₂ -C ₄
Benzene	Hexane	Thiophene group
Biphenyl	Hydrogen sulphide	Toluene
C ₁₇₊ aliphatic group	Isopropylbenzene	Xylenes

- c. As described in the response to Part a, routine flaring from the reject system is not anticipated.

10	<p>Volume 1, Sections 3.5.3.9, 3.3.3, 5.1.2 and 5.2, Tables 3.5-10, 5.1-1, and 5.2-1, Figures 3.3-2, 5.2-1 and 5.2-2, Pages 23, 39, 63, 74, 79 and 80</p> <p>The coke production/consumption volumes are not consistent between the various tables and figures.</p> <ul style="list-style-type: none">• Table 3.5-10 and Figures 5.2-1 and 5.2-2 indicate 3,700 t/d coke consumption for each gasifier (7,400 t/d total).• Table 5.2-1 indicates 3,257 t/d coke consumption for each gasifier (6,514 t/d total).• Table 5.1-1 indicates a total coke production exclusive of gasification of 6,960 t/d.• Figure 3.3-2 indicates a net coke production inclusive of gasification of 509 t/d. <p>a. Clarify the apparent discrepancy in reported coke production/consumption and provide revised tables/figures as appropriate, including energy and sulphur balance tables.</p>
----	--

Response

- a. The 3,700 t/d petcoke feed to each gasifier includes the moisture content of 12% which is the expected moisture content in the coke pit after drainage. The green petcoke or dry petcoke feed rate is therefore 3,257 t/d as shown in [Volume 1, Section 5, Table 5.2-1](#).

The total dry petcoke production in [Volume 1, Table 5.1-1](#) (6,960 t/d) is correct. For the Project, the dry petcoke consumption by the gasifiers is 6,514 t/d leaving a net dry petcoke balance of 446 t/d and not 509 t/d as shown in [Volume 1, Figure 3.3-2](#). [Figure 5-1](#) is a revised Volume 1, Figure 3.3-2.

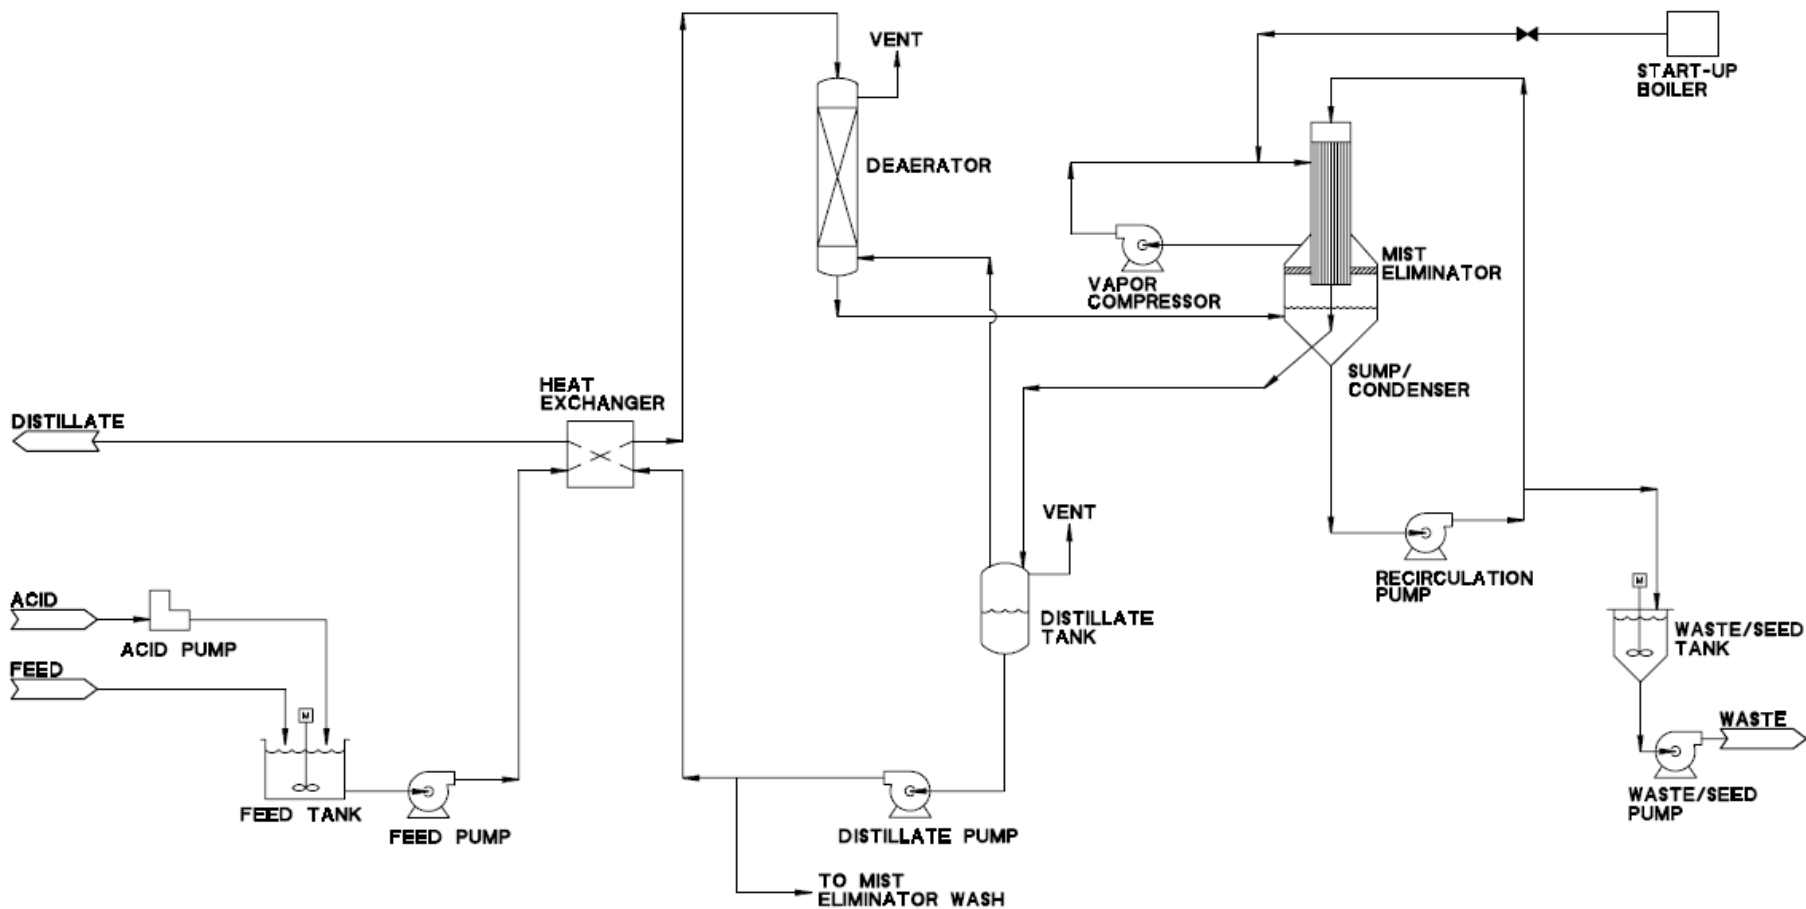

11	Volume 1, Section 4.3.2.1, Page 56 Provide further details as to the operation of the evaporation process, including a material balance and process flow diagram.
----	---

Response

The evaporation process will involve the recovery of distilled water from low organic waste streams, including cooling tower and boiler blowdowns. Implementation of the evaporation process will be staged, with the first stage required prior to gasification when the Upgrader capacity expands to 243,000 bpsd. Zero Liquid Discharge (ZLD) treatment is necessary to eliminate all process discharges to the North Saskatchewan River for the Project. Implementation of the evaporation process is required based on the river withdrawal and discharge requested in the StatoilHydro application.

At this time, engineering is focussed on Phase 1 development, and the evaporation process is at the concept stage. An updated water balance for the Project is provided in [SIR Response 81](#). The updated water balance shows the integration of the evaporation process into the Upgrader. A more detailed material balance around the evaporator will be developed in future engineering phases.

The concept for the evaporation process will involve an upstream scavenger reverse osmosis unit to concentrate the evaporator feed streams followed by treatment in an evaporation unit. Recovered water will be used as cooling tower make-up and/or boiler make-up water. Concentrated brine will be injected into a deep well near the project site, or sent off-site to a third-party for disposal. A typical evaporator schematic is provided in [Figure 11-1](#).

----	--

Response

- a. Chemical storage facilities will be located in as few areas as is practical and will not typically exceed the amount that would be required for 14 days. Chemicals with the highest rates of consumption, such as sodium hydroxide (caustic soda) and sodium hypochlorite, will be stored in the chemical tank farm as well as in smaller satellite tanks or totes in the process unit areas as required. Specific process chemicals (e.g., anti-foaming additives and amines) will be stored in their appropriate process unit areas. Exact locations of stored chemicals will be determined during the detailed engineering phase.

[Table 12-1](#) below contains details specific to the chemicals and catalysts known to be used in certain process areas as well as their approximate consumption and information relating to how/if they will be stored on-site.

Table 12-1 Location and Quantity of Catalysts and Chemicals for the Project

No.	Chemical	Process Area/Unit	Consumption	On-site Storage
1	Activated Alumina	Sulphur Recovery Unit	455 m ³ every fourth year	Stored in catalyst staging area during turnarounds.
2	Ammonia Solution	Diluent Recovery Unit	109 m ³ /year	4.5 m ³ stored in tote / tank in listed process area(s).
3	Ammonium Polysulphide	Delayed Coker Unit	116 m ³ /year	4.5 m ³ stored in tote / in listed process area(s).
4	Anti-Foam (NALCO EC9091A)	Delayed Coker Unit, Tail Gas Treatment Unit, Sour Water Stripper, Naphtha Hydrotreater	116 m ³ /year	4.5 m ³ stored in tote / tank in listed process area(s).
5	Arctic Diesel	Tank Farm	TBD ¹	Located at vehicle fuelling station and near firewater pumps.
6	Cationic Polymer (to DAF)	Wastewater Treatment Unit	19 t/year	0.72 m ³ stored in tank in wastewater chemical treatment building.
7	Caustic Soda, 50% (NaOH)	Sulphur Recovery Unit, Sour Water Stripper, Wastewater Treatment Unit	576 t/year	22 t stored in tank in chemical tank farm with satellite tanks throughout the plant plus a tank in the wastewater chemical treatment building.
8	Citric Acid	Water Treatment Unit	12.4 t/year	Assume membranes cleaned every 2 months, need to store 0.5 t. Tank in wastewater chemical treatment building.
9	Co-ordinating Phosphate (PO ₄)	Boiler Feedwater Treatment	306 t/year	12 t tank in boiler house.
10	Corrosion Inhibitor (BPR81202)	Bulk/Distillate Hydrotreater, Naphtha Hydrotreater, Gas-oil Hydrotreater, Hydrocracker	14 m ³ /year	0.6 m ³ stored in tote / tank in listed process area(s).
11	Corrosion Inhibitor (Halogen Resistant Azole-HRA)	Cooling Water	185 m ³ /year	7 m ³ stored in tote / tank next to cooling water tower.
12	De-Emulsifier (RESOLVE EC2345A)	Delayed Coker Unit, Desalter & Diluent Recovery Unit	289 m ³ /year	11 m ³ stored in injection tanks in listed process area(s).
13	Demulsifier (BPR27140)	Wastewater Treatment	37 t/year	1.4 m ³ stored in tank in wastewater chemical treatment building.
14	Dimethyl Disulphide (DMDS)	Bulk/Distillate Hydrotreater, Naphtha Hydrotreater	136.8 t every fourth year	As required, brought into process areas during turnarounds only.

No.	Chemical	Process Area/Unit	Consumption	On-site Storage
15	Ethyl Mercaptan	Natural Gas System (Odourizer)	~ 1 lb per MMSCF	Gas cylinders in utility area.
16	Methyldiethanolamine (MDEA)	Delayed Coker Unit, Tail Gas Treatment Unit, Sulphur Recovery Unit, Bulk/Distillate Hydrotreater, Naphtha Hydrotreater, VGO Hydrocracker, Amine Regeneration Unit	932 t (initially) + 232.8 t/year	Make-up required periodically, not stored on-site.
17	Natural Gas	Plant wide	TBD ¹	None - piped into site
18	Neutralizing Amine	Boiler Feed water	306 t	12 m ³ tank in Boiler house.
19	Nitrogen Gas	Plant wide (tank blanketing and flare purging)	TBD ¹	Liquid N ₂ Tank sized for 4 days, gas cylinders in various process areas.
20	Phosphoric Acid 80%	Wastewater Treatment Unit	TBD ¹	Tank in wastewater chemical treatment building, continuous feed.
21	Poly Aluminum Chloride	Raw Water Treatment Unit	4,126 t/year	340 t in solution stored in tank in utility area.
22	Process Anti-Foulant (EC9092A)	Water Treatment	36 m ³ /year	1.4 m ³ stored in totes in wastewater chemical treatment building.
23	Reserse De-emulsifier (Tretolite PAO0108F)	Wastewater Treatment	9,300 kg/year	360 kg stored in wastewater chemical treatment building
24	Soda Ash Solution (Sodium bicarbonate)	Naphtha Hydrotreater, Bulk/Distillate Hydrotreater, Gas-Oil Hydrotreater, VGO Hydrocracker, Wastewater Treatment Unit	37.3 t every fourth year + 150 t in wastewater treatment unit.	37.3 t trucked in as required to process areas for use in turnarounds. 10 t stored in tank in wastewater chemical treatment building.
25	Sodium bisulfite	Water Treatment Unit	8,800 kg/year	350 kg stored in wastewater chemical treatment building.
26	Sodium Hypochlorite	Cooling water, Water Treatment, Wastewater treatment	17,216 m ³ /year	660 m ³ stored in chemical tank farm and satellite tanks in various process areas.
27	Sodium Metabisulfite	Boiler Feedwater Treatment	31 t/year	1.5 t stored in boiler house.
28	Solids Dewatering Polymer	Wastewater Treatment Unit	1,000 kg/year	40 kg bags in wastewater chemical treatment building.
29	Sulphuric Acid	Utilities, Wastewater Treatment Unit	1,164 m ³ /year	50 m ³ tanks in chemical tank farm and piped to the process units.

¹ TBD = to be determined

- b. Potential interactions between stored chemicals and wastes will be avoided through the development and implementation of chemical and waste management programs. Process chemicals and waste streams will not be stored together to avoid potential interactions. The particulars of the chemical and waste management programs will emerge during the detailed engineering design phase of the Project. Elements of the programs will include design controls, proper ventilation or vapour recovery, secondary containment, segregated drainage, awareness and safety training programs including the knowledge of incompatible chemicals. The following regulatory considerations and guidelines will form the basis of the chemical and waste management programs:
- i. Transportation of Dangerous Goods (TDG) legislation
 - ii. Workplace Hazardous Materials Information System (WHMIS) program, including labeling, training, and Material Safety Data Sheets (MSDS)
 - iii. Energy Resources Conservation Board (ERCB) Directive 058, Oilfield Waste Management Requirements for the Upstream Petroleum Industry
 - iv. ERCB Directive 055, Storage Requirements for the Upstream Petroleum Industry
 - v. Alberta Fire Code
 - vi. *Alberta Occupational Health and Safety Act, Regulation, and Code*
 - vii. *The Waste Control Regulation* under the *Alberta Environmental Protection and Enhancement Act*, as well as the User Guide for Waste Managers
 - viii. Alberta Environment's Guidelines for Secondary Containment for Aboveground Storage Tanks
 - ix. StatoilHydro's chemical storage and waste handling standards

[SIR Response 14](#) provides more information on waste streams and waste disposal locations.

- c. Not all hazardous by-products that could potentially be formed are specifically identified due to many possible interactions that one could consider given the number of substances present on the Project site. However, as outlined in Part b, above, appropriate chemical and waste management programs will minimize potential interactions and prevent the formation of hazardous by-products.

The process design of the piping and storage system for piped chemicals will include appropriate valves and controls to isolate any accidental releases. The inherent safety in process design calls for hazard operability analyses (HAZOPs) which will identify hazards and risks (including chemical storage and handling) and which technical measures are required to eliminate, isolate and/or mitigate these risks. The appropriate process design controls and operational procedures will be developed prior to start-up in order to minimize the formation of hazardous by-products.

- d. In terms of containment and environmental protection measures, StatoilHydro has strict standards as to how chemicals and wastes are handled and stored. These standards will be employed in the chemical and waste management programs that will be created for the Project once detailed engineering has been completed.

Examples of containment measures include:

- i. Bulk chemicals will be delivered in a manner that will reduce handling of materials.
- ii. The storage areas for bulk chemicals will be curbed or diked with segregated drainage to sewers.
- iii. For non-bulk chemicals delivered in drums: an enclosed, heated storage area with controlled drainage to sewers will be provided in the warehouse area.
- iv. Firewalls in chemical storage locations will be installed according to the Alberta Fire Code and the Alberta Building Code.
- v. For layout of the storage areas consideration will be given to the incompatibility of different chemicals.
- vi. Chemical storage facilities will be concentrated in as few areas as practically possible.

Other considerations include recommendations as per Alberta Environment's (AENV) Guidelines for Secondary Containment for Above Ground Storage Tanks, AENV's Hazardous Waste Storage Guidelines, the Alberta Fire Code and other regulations or guidelines as required under AENV's *Environmental Protection and Enhancement Act*.

Additionally, environmental protection measures will include incorporating stormwater runoff segregation from the chemical storage and unloading areas such that it will remain separate from other on-site runoff. Within the chemical storage areas, segregated drainage and ventilation will be installed as required to minimize undesirable reactions between chemicals should a leak or spill occur. The main chemical unloading area will be situated away from the vehicle fuelling station to eliminate potential reactivity. Additionally, the chemical truck unloading areas require canopies, dripless unloading nozzles, and segregated sump pumps to contain any spilled chemicals. Should a spill occur, operational procedures will mandate prompt attention to cleaning out the affected sump(s). Vapour recovery systems will be required over some of the main chemical or waste tanks.

13	<p>Volume 1, Sections 5.1 and 6.5, Tables 5.1-5, 5.1-6, 5.1-7, 5.1-8, 5.2-5, 5.2-6, 5.2-7, 5.2-8, and 6.5-1, Pages 63 to 78, and 94</p> <p>The Terms of Reference, item 3.7 b), states <i>Describe and provide a listing of chemical products to be used for the Project. Identify products containing substances that are: i) Canadian Environmental Protection Act toxics; ii) on the PSL1, PSL2, and ARET lists and those defined as dangerous goods pursuant to the federal Transportation of Dangerous Goods Act. Classify the waste generated and characterize each stream under the Alberta User Guide for Waste Managers; iii) on the NPRI; iv) Track 1 substances targeted under Environment Canada's Toxic Substances Management Policy.</i></p>
	a. Identify which of the chemical products listed under Tables 5.1-5, 5.1-6, 5.1-7, 5.1-8, 5.2-5, 5.2-6, 5.2-7, and 5.2-8 contain substances that are: <i>Canadian Environmental Protection Act</i> toxics; on the PSL1, PSL2, and ARET lists and those defined as dangerous goods pursuant to the federal <i>Transportation of Dangerous Goods Act</i> .
	b. Identify which of the waste streams listed under Table 6.5-1 are on the NPRI; and the Track 1 substances targeted under Environment Canada's <i>Toxic Substances Management Policy</i> .

Response

- a. [Table 13-1](#) below provides listing information for chemical and catalyst substances identified in [Volume 1, Tables 5.1-5, 5.1-6, 5.1-7, 5.1-8, 5.2-5, 5.2-6, 5.2-7 and 5.2-8](#). In the case of chemical mixtures (identified by trade name or service function) where a Material Safety Data Sheet (MSDS) was available, all the constituents were assessed for each of the lists identified.

Table 13-1 Proposed Chemicals and Catalysts

Chemical/Catalyst	CEPA	PSL1	PSL2	ARET	TDG
Activated Alumnia (Aluminum Oxide)					
Adsorbent	TBD				
Anhydrous Ammonia					x
Ammonium Polysulphide					x
Anion Exchange Resin (Dowex Marathon A)	x	x			
Antifoam (BPR 45140)					
Antifoam (NALCO EC9019A)					x
Antiscalant	TBD				
Artic diesel (98% methanol)	x				x
Cation Exchange Resin (Dowex Marathon MSC)	x	x			
Cationic Polymer (to DAF)	TBD				
Caustic Soda (NaOH)					x
Citric Acid (C ₆ H ₈ O ₇)					
Coordinating PO ₄ (phosphate)					
Corrosion Inhibitor (BPR81202)	x	x			x
Corrosion Inhibitor (Unicor C)					x
Corrosion Inhibitor w/ HRA (AZ8104)					x
De-Emulsifier (RE-SOLV EC2345A)					
Demulsifier (BPR27140)	x	x			x
Dimethyl Disulphide (DMDS)					x
Dispersant	TBD				
Drying Agent (Desiccant)	TBD				
Ethyl mercaptan					x
Flux (corrosion inhibitor)	TBD				

Chemical/Catalyst	CEPA	PSL1	PSL2	ARET	TDG
H ₂ S Absorbant (Selexol)					
HC-DM-3Q (Mo, Ni, Alumina-silica catalyst)	x	x			
HT Shift Catalyst (NiMo)	x			x	
Hydrogenation (Co, Mo)	x			x	
Hydrogenator Catalyst (NiMo)	x	x		x	
KF-542-5R (Ni, Co, Mo & Alumina Catalyst)	x	x		x	
KF-542-9R (Ni, Co, Mo & Alumina Catalyst)	x	x		x	
KF-647-1.3Q (Mo, Ni, Alumina catalyst, Presulphided)	x	x		x	x
KF-647-3Q (Mo, Ni, Alumina catalyst, Presulphided)	x	x		x	x
KF-848-1.3Q (Ni, Mo, Alumina Catalyst)	x	x		x	
KG-55 (inert)					
MDEA (methyldiethanolamine)					
Mole Sieve Adsorbant (Na ₂ O, amorphous silica, Al ₂ O ₃)					
N-205 (Mo, Ni, Alumina-silica catalyst)	x	x			
Natural Gas	x				x
Neutralizing Amine	TBD				
Ni Catalyst (Ni, Mo, Alumina Catalyst)	x	x		x	
Nitrogen Gas					x
Phosphoric Acid					x
Poly Aluminum Chloride (PAICl)					x
Process Antifoulant (EC9092A)					x
Reformer Catalyst (NiO)	x	x		x	
Reverse De-Emulsifier (Tretolite PAO0108F)					x
Slurry additive (viscosity reduction)	TBD				
Soda Ash (Sodium Bicarbonate)					x
Sodium Bisulfite (NaHSO ₃)					x
Sodium Hypochlorite (NaOCl)					x
Sodium Metabisulfite (Na ₂ S ₂ O ₅)					
Solids Dewatering (Anionic) Polymer	TBD				
Sulfuric Acid (H ₂ SO ₄)					x
Titania (TiO ₂)					
Zinc Oxide					

¹ CEPA – Schedule 1, *Canadian Environmental Protection Act* toxic substance

² PSL1 – Environment Canada's Priority Substances Assessment Program, Priority Substance List 1

³ PSL2 - Environment Canada's Priority Substances Assessment Program, Priority Substance List 2

⁴ ARET - Accelerated Reduction/Elimination of Toxics

⁵ TDG – Schedule 1 substances that require specific identification when being transported due to a hazard pursuant with the *Transportation of Dangerous Goods Act*

⁶ TBD - chemicals and/or catalysts not chosen at this time.

- b. The waste streams identified in [Volume 1, Table 6.5-1](#) have been updated since the Application was filed. [Table 14-1](#) is a modified Table 6.5-1 (see [SIR Response 14](#)).

The exact compositions of some waste streams will not be known prior to completion of detailed engineering; and are identified as To Be Determined (TBD) in [Table 13-2](#). Under the requirements of the National Pollutant Release Inventory (NPRI), minimum thresholds for certain substance groupings (CACs, VOCs, PAHs, etc.) must be met before reporting is mandatory. For waste streams or releases, disposal and transfers, NPRI reporting is broken down into four categories which include:

1. On-site releases;
2. Final disposal activities (both on- and off-site);
3. Off-site transfers for treatment prior to final disposal; and
4. Off-site transfers for recycling and energy recovery.

Table 13-2 below provides the updated waste streams, their expected constituents and whether or not they are anticipated to be NPRI or Track 1 reportable.

Track 1 substances under Environment Canada's Toxic Substances Management Policy (TSMP) are defined as bioaccumulative, persistent, predominantly anthropogenic and CEPA "toxic" as defined in Schedule 1 of the *Canadian Environmental Protection Act*. Track 1 substances are slated for virtual elimination from the environment. The Track 1 list currently contains 12 substances which are known as persistent organic pollutants (POPs). The Track 1 list of substances was published in Volume 132, Number 27 of the Canada Gazette in 1998. None of the substances identified in the Gazette will be produced, used or stored in any amount on the Project site as is reflected in Table 13-2. Furthermore, none of the waste streams presented in Table 13-2 are listed as a Track 1 waste.

Table 13-2 Waste Stream NPRI and CEPA Reporting Requirements

Waste Stream	Composition	NPRI	Track 1
Amine, spent	MDEA, H ₂ O and dissolved solids		
Boiler blowdown water	H ₂ O and dissolved solids		
Catalyst, spent	CoMo, NiMo, alumina and petcoke	x	
Construction material	wood, metals, plastics		
Contaminated debris or soil, petroleum	soil, hydrocarbons	x	
Contaminated soil, sulphur	soil, elemental sulphur particles	x	
Cooling tower sludge	TBD	TBD ¹	
Corrosion inhibitor / Oxygen scavenger	TBD	TBD ¹	
Carbon filters	carbon, oil droplets	x	
Cartridge filters	metal, ceramic, polypropylene, PM	x	
Desiccant	TBD	TBD ¹	
Domestic garbage	variable		
Lubricating oil for pumps, compressors	hydrocarbons	x	
Methanol (for freeze protection in process)	methanol, H ₂ O	x	
Other chemicals	soda ash, NaOH, H ₂ SO ₄ , polyaluminum chloride, sodium hypochlorate, citric acid, antiscalant, cationic polymer	TBD ¹	
Pond skimming	hydrocarbons	x	
Pigging waste, done only during turnarounds	hydrocarbons, wax and undissolved compounds	x	
Pond bottom sludge	organic materials	x	
Refractory ceramic fibre	man made aluminosilicate fibres, amorphous silica, H ₂ O, propylene glycol		
Sanitary sewage	sewage		
Spill debris	absorbing products and spill material	TBD ¹	
Laboratory waste	various organic and inorganic chemicals	TBD ¹	
Used chemical storage drums	various inorganic chemicals	TBD ¹	
Used crankcase oils	hydrocarbons and metal fragments	x	

¹ TBD = to be determined

14	<p>Volume 1, Section 6.5, Table 6.5-1, Pages 94 to 96 The Terms of Reference, item 3.1 f), states <i>Describe... the types and amounts of waste materials, locations of wastes storage, and disposal sites.</i></p> <p>a. Update Table 6.5-1 to include amounts and locations of storage, as required by the Terms of Reference.</p>
----	---

Response

- a. **Table 14-1** (Table 6.5-1 Revised) has been updated to include waste amount, composition, storage location and disposal method. However, volumes and exact composition of waste for many of the items listed in **Table 14-1** cannot be quantified prior to completion of detailed engineering work or the collection of operating data.

Table 14-1 (Table 6.5-1 Revised) Waste Storage and Disposal

Waste	Annual Amount		Storage Location	Disposal Method
	Phase 1	The Project		
Amine, spent	77 tonnes	233 tonnes	Spent amine tank	Returned to supplier for recycle
Boiler Blowdown water, 3% of rate on an average annual basis	30,000 m ³	100,000 m ³	Sludge pond	Sludge pond
Catalyst, spent	497 m ³ (annualized)	1,542 m ³ (annualized)	Spent catalyst storage bins	Returned to vendor or sent to approved disposal facility
Methanol (for freeze protection in process)	Volumes of waste cannot be quantified at this time, require operating data		Designated storage area	Returned to process
Used chemical storage drums	Residue on sides of used drums		Designated storage area	Returned to supplier or recycle facility
Other chemicals	1,650 tonnes	5,600 tonnes	Local collection containers at designated sites	Returned to vendor for recycle
Construction material	400 to 500 tonnes	1,200 to 1,500 tonnes	Local collection drums at designated sites	Recycled or sent to landfill
Contaminated debris or soil, petroleum	20 to 25 tonnes	60 to 75 tonnes	On-site bins	Oilfield waste treatment facility
Contaminated soil, sulphur	4 to 5 tonnes	10 to 12 tonnes	On-site bins	Oilfield waste treatment facility
Corrosion inhibitor / Oxygen scavenger	To be determined		Storage drums in tank farm	To be determined, dependant on type chosen
Desiccant	272 m ³	826 m ³	To be determined, dependant on type chosen	To be determined, dependant on type chosen

Waste	Annual Amount		Storage Location	Disposal Method
	Phase 1	The Project		
Carbon filters	Number of filters to be determined during detailed engineering		Filter housings	Returned to supplier for regeneration
Cartridge filters	Number of filters to be determined during detailed engineering		Local collection containers at designated sites	Sent to approved disposal facility
Domestic garbage	Varying depending on staffing levels		Local collection containers at designated sites	Sent to municipal landfill or recycled if aluminum, plastic, glass or paper
Lubricating oil for pumps, compressors	20 to 25 m ³	30 to 35 m ³	Local collection drums at designated sites	Recycled via contractor
Pond skimming	1 to 2 m ³	3 to 4 m ³	Slop oil tank	Recycled back into the process
Pigging waste, done only during turnarounds	1 to 2 m ³	3 to 6 m ³	Slop oil tank	Recycled back into the process
Cooling tower sludge	Unknown pending chemical program		Removed during maintenance	Sent to approved disposal facility
Pond bottom sludge	To be determined	To be determined	in-situ sludge pond	Cover in place
Sanitary sewage	Varies with staffing levels		Effluent pond	Treated in on-site biological wastewater treatment facility. Treated effluent sent to effluent pond and/or recycled internally. Wastewater sludge sent to approved treatment and disposal facility
Spill debris	Goal of site is for zero spills. Data collected during operation.		Local collection container at designated sites	Sent to approved disposal facility
Laboratory waste	20 to 25 m ³ . Varying dependant on sampling programme.		Local collection containers at designated sites	Disposed of via laboratory water contractor
Refractory Ceramic Fibres	Normally none Some will be produced during regular maintenance shutdowns		Local collection containers at designated sites	Disposal based on specific waste characterization, to be determined
Used Crankcase Oil	3,200 L		Local collection drums at designated sites	Recycled via contractor

15	Volume 1, Section 6.5, Pages 94 to 96 The Terms of Reference, item 3.7 a), states <i>Describe and provide the composition and volume of specific waste streams generated by the Project, and identify how each stream will be managed. Demonstrate that the selected practices comply with provincial and federal legislations including EPEA's Waste Control Regulation and Alberta Environment's Hazardous Waste Storage Guidelines.</i>
	a. Provide information on volume of specific waste streams and procedures to prevent leakage and ensure containment of hazardous waste as required by the Terms of Reference and the <i>Waste Control Regulation</i> .

Response

- a. See [SIR Response 14, Table 14-1](#), as well as [SIR Response 12, parts b and d](#).

16	<p>Volume 1, All Sections</p> <p>Detailed information is provided for Phase 1, the Project without gasification, and the Project with gasification 1 and 2, however, between Phase 1 and the Project, throughput is increasing by 163,000 bpsd and additional process units are being added.</p> <p>a. Unless the throughput is increasing in a single additional phase, provide material, sulphur, water and energy balances, and process flow diagrams for each phase of the project from Phase 1 to full throughput.</p>
----	--

Response

- a. At this stage in the Project design, the phasing steps of the Upgrader are not fixed. StatoilHydro is applying for approval of the 243,000 bpsd Project. The second phase of the Upgrader could involve a debottleneck of Phase 1 to 143,000 BPSD plus the addition of a second Upgrader train of 100,000 bpsd. However, engineering design is not sufficiently advanced in order to define the scope of the incremental phases(s). StatoilHydro will continue to update the Alberta Energy Resources Conservation Board as project design advances on the incremental phases.

AIR

17	<p>Volume 1, Section 1.2, Page 5</p> <p>Statoil states <i>A portion of the site will remain undeveloped to preserve existing wetlands.</i> These areas in addition to the ¼-section north of the facility (North Wetland Complex) have been set aside as a preservation area. The air quality study area and predictions appear to include these preservation areas within the property line where ambient air objectives could be exceeded.</p> <p>a. Confirm that the areas to be set aside will have predicted air quality concentrations less than the Alberta Ambient Air Quality Objectives (AAAQO).</p>
----	---

Response

- a. [Table 17-1](#) below shows the maximum predicted concentrations on the indicated quarter section (SE 2-56-21-W4M) for the Baseline, Project Only, Application and Cumulative Assessment cases. [Table 17-1](#) also shows the respective Alberta Ambient Air Quality Objectives (AAAQO), ambient guideline (for 1-h average PAI) and Canada Wide Standards (CWS). For all assessment cases, the maximum predicted values are all less than the ambient air quality criteria.

Table 17-1 Maximum Predicted Ambient Air Concentrations in the ¼ Section to the North of the Facility

		Baseline	Project Only	Application	Cumulative	AAAQO/ Guideline/ CWS
1-h SO ₂ Concentration	ug/m ³	127	279	308	328	450
24-h SO ₂ Concentration	ug/m ³	49.9	57.8	72.8	131	150
Annual SO ₂ Concentration	ug/m ³	6.25	1.00	7.12	13.3	30
1-h NO ₂ Concentration	ug/m ³	94.9	103.8	107.3	110	400
24-h NO ₂ Concentration	ug/m ³	54.7	33.5	60.2	63.5	200
Annual NO ₂ Concentration	ug/m ³	13.4	1.14	14.3	20.0	60
1-h CO Concentration	ug/m ³	1,783	77.6	1,830	1,830	15,000
8-h CO Concentration	ug/m ³	1,518	40.4	1,553	1,554	6,000
1-h PM _{2.5} Concentration	ug/m ³	58.2	20.3	58.5	78.9	80
24-h PM _{2.5} Concentration	ug/m ³	15.6	3.64	17.0	21.5	30

18	Volume 1, Section 1.5, Page 10 Statoil states <i>The Project will be well prepared should the Alberta Government proceed to establish caps on both SO₂ and NO₂ emissions in the AIH.</i>
	a. Discuss what source and emissions changes would be implemented if the emission caps were introduced. Discuss the economic feasibility of these changes.
	b. Since <i>The Project will be well prepared...</i> , explain why Statoil is not implementing these changes now at the developmental phase of the Project.

Response

- a. StatoilHydro is actively participating in the Industrial Air Management Area (IAMA) working group formed by the Alberta Minister of Environment to develop the Regional Air Management Framework. Because this Framework is not complete, emission standards to achieve set “thresholds” have yet to be determined. Based on StatoilHydro’s understanding of the status of this Framework, StatoilHydro submits that the Project as currently proposed will meet the emission standard for both SO₂ and NO_x. The addition of more stringent abatement controls than those that have been selected by StatoilHydro would significantly increase capital costs and decrease the economic viability of the Project.
- b. The current design of the facility is expected to meet the Regional Air Management Framework.

19	<p>Volume 1, Section 1.5, Page 10 Provide a table summarizing the environmental, health, and economical pros/cons for gasification of petcoke as a fuel source to replace the relatively clean burning natural gas.</p>
----	---

Response

Although the sole purpose of the gasification units is not to produce synthetic natural gas (SNG) to replace natural gas, the general environmental, health, and economical pros/cons for gasification of petcoke as a fuel source to replace natural gas are presented qualitatively in [Table 19-1](#).

Table 19-1 Comparison of Gasification

Gasification to Produce SNG	Pros	Cons
	Offsets natural gas purchases	Capital Intensive
	Reduces natural fossil fuel demand	High Operating Cost
	Uses a zero value feedstock	High Maintenance Cost
	Maximizes the value of bitumen resource	Lower reliability
	Reduces export of petcoke to countries with lower emissions standards	Increased water consumption
	Ability to recover CO ₂ pre-combustion	Increased waste for landfill
	Ability to recover sulphur	Increased materials handling costs and risks
		Complex operating Unit
		Requires a sustainable natural gas price of \$12-15/GJ or higher
Natural Gas Consumption	Pros	Cons
	Little or no capital infrastructure required	Impacts on the natural gas demand supply balance potentially resulting in an increase in the natural gas price
	Lower CO ₂ emissions overall	
	Lower SO ₂ emissions overall	

20	Volume 1, Section 3.5.3.2, Page 36 Describe the management plans Statoil will implement to minimize dust emissions from petroleum coke storage.
----	---

Response

Dust suppression systems will be in place at all transfer points on the conveyor system and at the rail loading. All conveyors and the working storage area will be enclosed to minimize dust from petcoke handling. Fugitive emissions are minimized on-site by closed handling, short conveying distances and wetting the petcoke to reduce dust emissions.

When the gasification units are constructed, hydrocarbon air emissions and particulate emissions from the petcoke grinding and slurry preparation section will be minimized by drawing a slight vacuum on the system and discharging the stream to the tail gas treating unit (TGTU) incinerator.

21	<p>Volume 1, Section 3, Pages 16 to 41</p> <p>It appears that electric power will be generated on-site for the gasification stages. However, the specifics of this proposal are not clear.</p> <p>a. Provide a more detailed discussion about the generation of power proposed at the project.</p> <p>b. Clarify if there will be any emissions directly associated with the generation of the power. If so, provide details.</p>
----	--

Response

- a. The gasification stages have an excess of heat as the syngas is cooled for treatment and further processing. The gasification units will operate as standalone units and will not be heat integrated with the Upgrader process units so as not to affect unit reliability. To optimize energy recovery, steam will be produced at various levels within the gasification units and used to drive three condensing steam turbines operating at different pressures for electric power production. A total of 60.9 MW will be produced from Gasification 1 and 95.1 MW from Gasification 2. The generated power will be consumed within the gasification process, leaving no excess for export.
- b. In Gasification 1, a significant portion of the power will be produced from the steam generated in the Pressure Swing Adsorption (PSA) tail gas boiler. [SIR Response 7](#) provides the emissions profile from this boiler. There is no PSA in Gasification 2 and therefore no additional emissions are associated with the power produced.

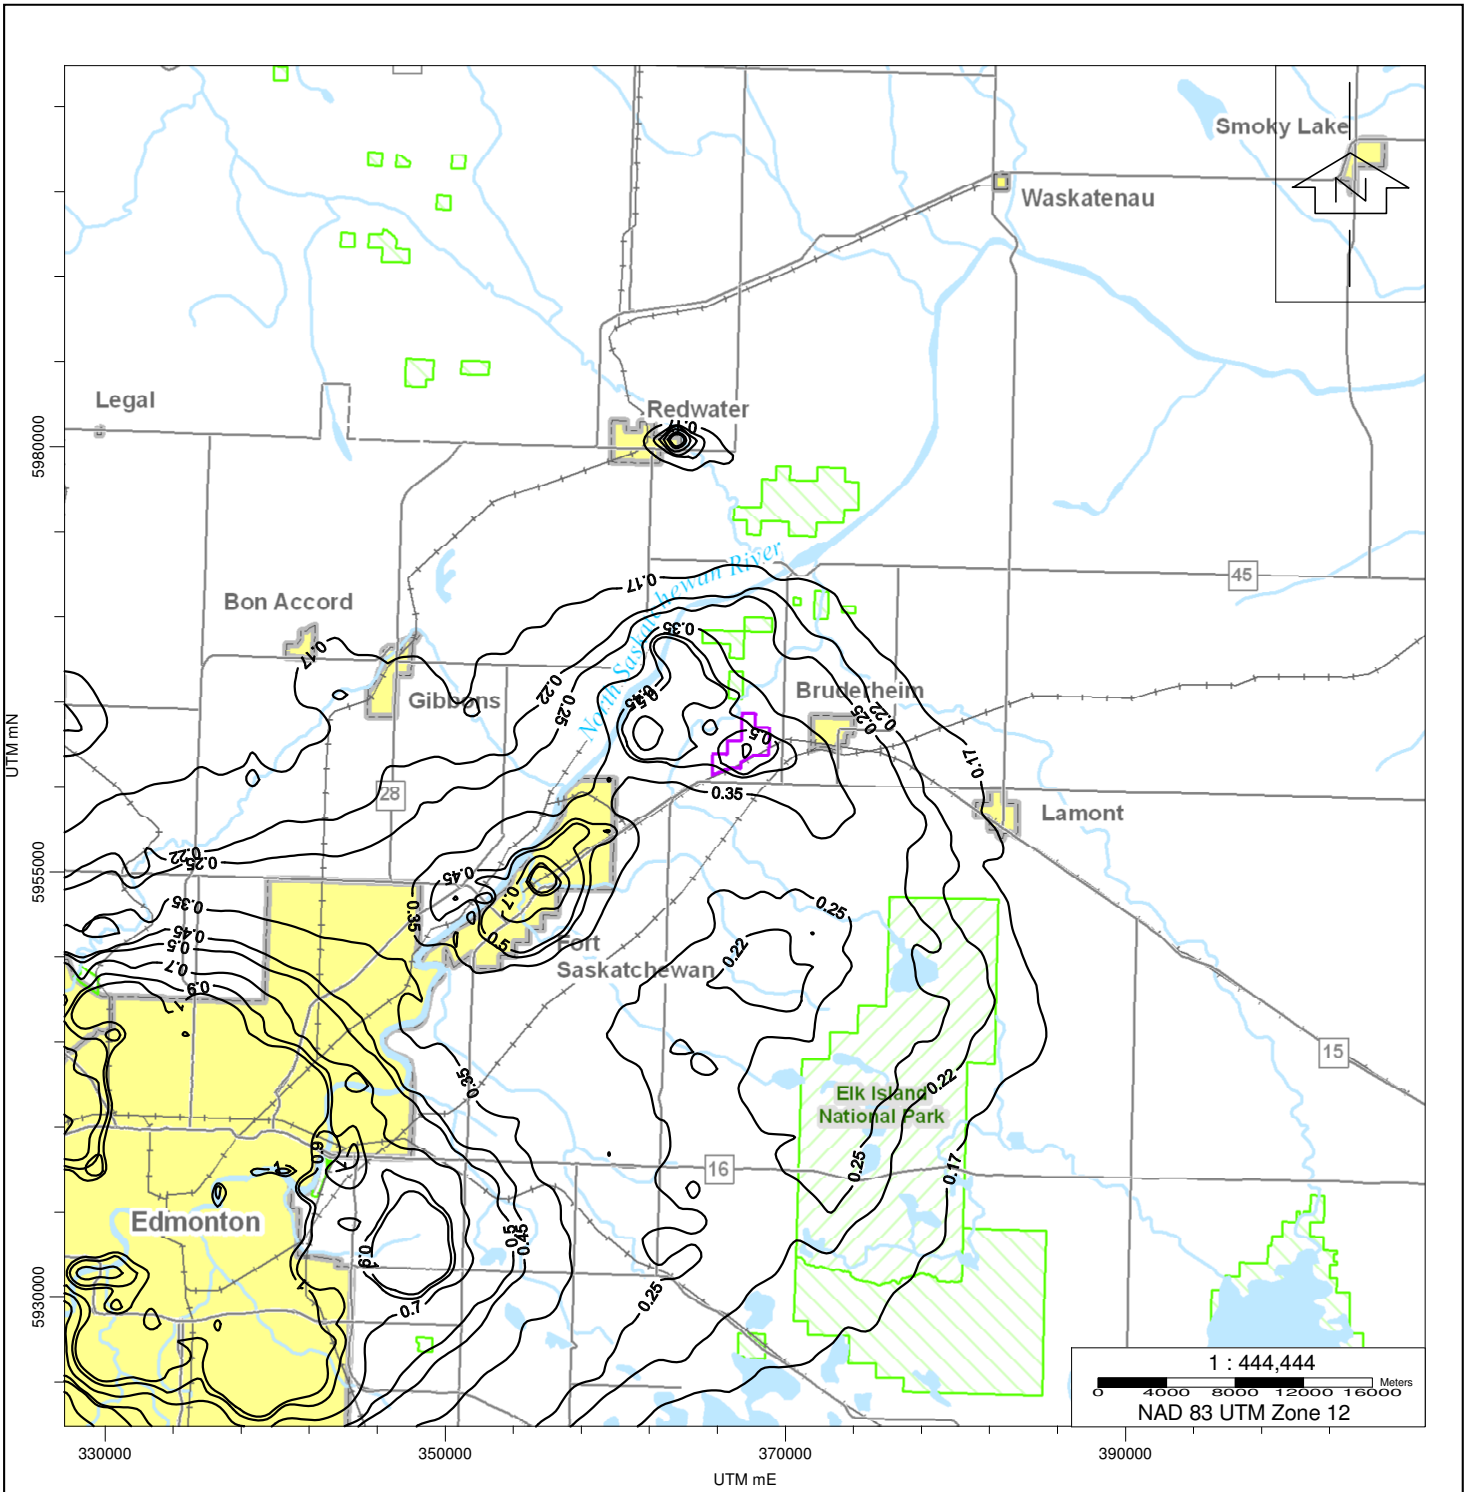

22	<p>Volume 1, Sections 5.1.5 and 5.2.5, Tables 5.1-4 and 5.2-4, Page 66 and 76, Volume 2, Section 2.6.1.2, Page 2-21</p> <p>Statoil states <i>The SRUs for the Project are designed for a sulphur recovery efficiency of 99.9% with an expected annual average recovery of 99.8%. On a quarterly basis, the expected minimum sulphur recovery for each SRU/TGTU complex is 99.5%.</i></p> <p>Dispersion modeling of long term SO₂ emissions considered a sulphur recovery efficiency of 99.8 per cent. As indicated in ERCB Decision 2007-058 the Board has stated its intention to regulate sulphur emissions within the Alberta Industrial Heartland on a regional basis. As such, the Board would expect that Statoil will achieve a minimum calendar quarter-year sulphur recovery of 99.5 per cent. Unless Statoil is requesting its sulphur recovery to be regulated at 99.8 per cent provide an assessment of the project's long- term SO₂ emissions at a calendar quarter-year sulphur recovery of 99.5 per cent.</p>
----	---

Response

The potential for the acidification of terrestrial and aquatic systems can span decades. For this reason, the SO₂ emission rate associated with a long-term sulphur recovery rate of 99.8% was used to estimate the potential acid input (PAI).

As the SO₂ emissions associated with a single calendar quarter sulphur recovery rate of 99.5% is not an expected or realistic long-term emission scenario, this case was not assessed. An Environmental Impact Assessment (EIA) typically adopts a "refined assessment" approach as defined in the Alberta Air Quality Model Guideline. Specifically, a refined assessment "more closely estimates actual air quality impacts". The modelling in the EIA has attempted to follow this approach with some bias to overstating. The use of a 99.5% would be a significant overstatement with SO₂ emissions from the Project being 18.14 t/d rather than the expected long term value of 7.34 t/d.

To meet this information request, the predicted PAI for the Application and Cumulative cases based on 99.5% sulphur recovery is shown in [Figures 22-1](#) and [22-2](#), respectively. As these PAI values are not based on a realistic emission profile, additional work to evaluate the terrestrial and aquatic implications of this case was not undertaken.

NOTE:

- Indicates data not available.

24	Volume 2, Section 2.5.1, Page 2-16 Statoil states <i>The CALMET model results were deemed to be representative, based on documented biases associated with the traditional approach.</i>
	a. Describe the biases in context of the traditional approach and provide reasons why the modeling predictions in the assessment based upon these biases are acceptable.

Response

- a. As indicated in [Volume 2, Appendix 2C \(Page 2C-30\)](#), the traditional method for estimating Pasquill-Gifford (PG) stability classes from airport measurements has been documented to overestimate the frequency of neutral atmospheric conditions (i.e., PG stability class D). The CALMET meteorological pre-processor, as applied to the 2002 meteorological data, indicated neutral conditions occur 39% of the time. The traditional approach applied to airport data indicates neutral conditions occur about 45% of the time. As the CALMET approach is more rigorous, the associated results are expected to provide a more realistic indication of the turbulence than the traditional approach. The CALMET results are viewed as being more acceptable on this basis.

To some extent, the comparison of the PG classes as determined by the two methods is somewhat academic since the CALPUFF model was applied using similarity scaling to estimate dispersion, not the traditional PG dispersion curves that are used by models such as SCREEN3 or ISCST3.

25	<p>Volume 2, Section 2.6.1.2, Page 2-21</p> <p>Statoil states <i>The heaters and furnaces will be fired with plant fuel gas and supplemented with natural gas when necessary. The sulphur content of the plant fuel gas will be 25 ppm (as H₂S equivalent) or less.</i></p> <p>a. Clarify how the sulphur content was determined.</p> <p>b. Explain how the sulphur content will be monitored.</p> <p>c. Discuss Statoil's operational plan if the sulphur content of the plant fuel gas is higher than expected.</p> <p>d. Discuss Statoil's position on whether the chosen technology to reduce the sulphur content of the plant fuel gas, and therefore reduce the associated SO₂ emissions, is consistent with Best Available Technology Economically Achievable (BATEA).</p> <p>e. Provide a discussion as to Statoil's position on whether the chosen technology to reduce the sulphur content of the plant fuel gas, and therefore reduce the associated SO₂ emissions, is consistent with Best Available Demonstrated Technology (BADT).</p>
----	--

Response

- a. The sulphur content was defined by StatoilHydro taking industry best practices into consideration. These are target design values and some operational variation is expected.
- b. The sulphur content will be monitored via an online fuel gas analyzer on the fuel gas stream.
- c. With the current design of the facilities and planned maintenance, the likelihood of the fuel gas being off specification is considered to be very low. If the fuel gas were to go off specification, remedial actions will be taken. StatoilHydro will comply with the conditions of the *Environmental Protection and Enhancement Act (EPEA)* Approval.
- d. The process used to reduce sulphur in the fuel gas is a conventional amine scrubbing system. It is StatoilHydro's position that this system is the most appropriate technology for the Project. StatoilHydro is not aware of a better technology that can achieve the same results with a large throughput. StatoilHydro submits that the fuel gas scrubbing system chosen is consistent with Best Available Technology Economically Achievable (BATEA).
- e. Although there are demonstrated technologies to further reduce hydrogen sulphide (H₂S) in the fuel gas stream such as fixed bed adsorbents, reactors and membrane technology, these technologies are most efficient at high pressures or temperatures and are therefore unsuitable for the Project. The technology chosen for the Project meets or exceeds current industry practices.

26	<p>Volume 2, Section 2.6.1.2, Page 2-21</p> <p>Statoil states <i>The furnaces and combustion turbine units will be designed to be more stringent than the CCME guidelines for NO_x and CO emissions. That is, low-NO_x burners will be used to reduce flue gas NO_x emissions, and, where technically feasible, the Project will use ultra-low NO_x burners.</i></p> <p>a. Discuss when Statoil will consider it technically feasible to use ultra low-NO_x burners.</p> <p>b. Discuss Statoil's position on whether the chosen technology (low NO_x burners) to reduce NO_x emissions is consistent with BATEA.</p> <p>c. Discuss Statoil's position on whether the chosen technology (low NO_x burners) to reduce NO_x emissions is consistent with BADT.</p>
----	--

Response

- a. As described in the Application, the Project will use ultra-low NO_x burners to reduce flue gas NO_x emissions in all cases except large furnaces such as coker heaters and incinerators. For the Project case, it will be technically feasible to use ultra low NO_x burners on all heaters except the large heaters such as the coker heaters and the tail gas treating unit (TGTU) incinerators. These heaters typically operate hotter, have multiple small burners and are therefore not suitable for use of ultra low NO_x burners. The burners in these instances will be low NO_x burners.
- b. StatoilHydro considers the installation of ultra low NO_x burners on most fired heaters to be consistent with Best Available Technology Economically Achievable (BATEA). For large heaters such as coker heaters and incinerators, low NO_x burners are considered as BATEA.
- c. The NO_x abatement technology described in the current design is not consistent with Best Available Demonstrated Technology (BADT). StatoilHydro will continually evaluate NO_x abatement technology to assess opportunities to reduce NO_x emissions even further.

27	Volume 2, Section 2.6.1.2, Page 2-21 <i>Statoil states Storage tanks carrying a sour product will be tied into a vapour recovery system or pressurized storage to reduce fugitive emissions associated with the handling and storage of intermediate and final product. A vapour control efficiency of 95% was assumed for tanks with vapour recovery. A Leak Detection and Repair (LDAR) Program will be implemented to identify and reduce fugitive emissions.</i>
	a. Does Statoil commit to no off-site odour impacts during normal operations?

Response

- a. StatoilHydro will endeavor to reduce off-site odours during normal operations. [SIR Response 40b](#) and [SIR Response 138](#) provide further discussion of StatoilHydro's odour mitigation and response procedures.

28	<p>Volume 2, Section 2.7.1.2, Table 2.7-2, Page 2-38</p> <p>The table identifies ten SO₂ emission scenarios with varying levels of significance regarding impacts. The results indicate that the Project will exacerbate existing 1-h SO₂ issues in the region.</p> <p>a. What is the likelihood and expected duration of each emission scenario?</p> <p>b. Provide a listing of the peak SO₂ concentrations (100%) associated with these events, and discuss potential impacts.</p>
----	--

Response

- a. The ten emission scenarios depicted in [Volume 2, Table 2.6-2](#) were selected to provide an indication of the potential range of SO₂ emissions that could occur from the Project. At this stage, it is difficult to indicate with certainty the likelihood of each scenario. Representative likelihood estimates are given as:
- StatoilHydro expects the sulphur recovery efficiency for the project to be 99.8% or better (i.e., Case A) greater than 90% of the time.
 - StatoilHydro expects one of the SRU/TGTU plant sulphur recoveries to be in the 99.5% range (e.g., Cases B, D, E or H) less than 10% of the time.
 - StatoilHydro expects one of the SRU/TGTU plant SO₂ emission rates to correspond to 1.4 times that associated with a 99.5% sulphur recovery (e.g., Cases C, F or G) less than 5% of the time.
 - StatoilHydro expects all SRU/TGTU plant sulphur recoveries to be simultaneously in the 99.5% range (e.g., Cases B, D, E or H) up to a maximum of 10 hours per year (i.e., less than 0.1% of the time).
- Cases I and J have a zero percent likelihood as the facilities are designed to be much more stringent than the ERCB sulphur recovery guidelines.
- b. The maximum concentrations associated with the ten emission scenarios are depicted in [Volume 2, Table 2.7-2](#). For all scenarios, the annual and 24-h Alberta Ambient Air Quality Objectives (AAAQO) are predicted to be met outside the plant property line. A 1-h exceedance is only predicted for Case H, eight times per year. The probability of an exceedance is given by $(10/8760) \cdot (8/8760) \cdot 8760 = 0.009$ hours per year or an exceedance once every 109 years.

29	Volume 2, Section 2.7.1.2, Table 2.7-2, Page 2-38 Statoil states <i>Case H</i> assumes all SRU/TGTU complexes are operating at 99.5% and is used to represent the Project when calculating 1-hour and 24-hour average SO ₂ concentrations and depositions. In Table 2.7-18, it appears that the Potential Acid Input (PAI) deposition assessment was based on SO ₂ emissions that appear to be based on a sulphur recovery efficiency of 99.8 per cent.
	a. Clarify which SO ₂ emissions were used to assess PAI deposition.

Response

- a. The SO₂ emission rates depicted for Case A ([Volume 2, Table 2.6-2](#)) were used to predict annual average SO₂ concentrations and potential acid input (PAI) deposition. The expected annual average emission rates were viewed as being appropriate to predict the annual average SO₂ concentrations and PAI deposition.

30	<p>Volume 2, Section 2.7.1.6, Table 2.7-5, Pages 2-44 and 2-48</p> <p>Statoil states <i>The maximum 24-hour concentrations, on average, are underpredicted by 49%</i>. Table 2.7-5 shows that the 24-hr concentrations will exacerbate short-term SO₂ issues even without the noted underprediction.</p> <p>a. Provide operational strategies or design mitigations that can be adopted to mitigate the predicted short-term (1-h and 24-h) concentrations.</p>
----	---

Response

- a. StatoilHydro has selected technology for the sulphur recovery with a nominal sulphur recovery efficiency of 99.8% on an annual basis. StatoilHydro's objective is to operate at this level on a continuous basis. Notwithstanding this goal, the performance of a sulphur recovery plant can vary. Prudent operatorship, operator experience and adaptive management processes will be used to minimize the occurrences of lower sulphur recoveries and to reduce the magnitude of the SO₂ emissions.

The predicted 24-hour average SO₂ concentrations shown in [Volume 2, Section 2.7.1.3, Table 2.7-5](#) are based on Case H when all five SRU/TGTU complexes are experiencing operational difficulties and are operating at 99.5% sulphur recovery. This is an unlikely scenario but was chosen to allow operating flexibility within the sulphur recovery units. The Project SO₂ emissions are expected to be represented by the Case A and Case B scenarios. Reading down [Table 2.7-2 in Volume 2, Section 2.7.1.2](#), towards Case J, the SO₂ emission rates and the associated SO₂ concentration predictions become less probable.

Operational procedures will include monitoring of analyzers through the distributed control system. Operator rounds will focus on optimal combustor operations in addition to the normal inspections for leaks, etc.

In case of operational problems with one of the SRUs, the first step will be to reduce feed rate to the hydroprocessing units to stabilize the situation and get control. Sudden shut downs are avoided as they invariably lead to high emissions flaring load.

The 1-h Alberta Ambient Air Quality Objective (AAAQO) is predicted to be exceeded for only eight hours a year ([Table 2.7-3, Volume 2, Section 2.7.1.2](#)) outside the Project property line (PPL), and the 24-h AAAQO is predicted to be exceeded for one day a year ([Table 2.7-5](#)) outside the Project PPL. No AAAQO exceedances are predicted at agricultural/residential or residential/community locations. Exceedances at the Project PPL assume the high emission rate associated with all sulphur recovery units operating simultaneously at 99.5% sulphur recovery and poor dispersion conditions. As indicated in [SIR Response 28](#), the expected frequency of an exceedance is negligible.

31	<p>Volume 2, Section 2.7.1.5, Page 2-48</p> <p>Statoil states <i>The model predictions show a potential for SO₂ concentrations to exceed the 1-hour and 24-hour AAAQO values near each respective operation; these exceedances are predicted to occur near the respective plant property lines. There are no predicted annual AAAQO exceedances, on- or off-site.</i></p> <p>a. Provide cumulative frequency distribution plots for 1-h and 24-hr predicted SO₂ concentrations at the maximum point of impingement (outside fencelines) for all scenarios (including project only).</p>
----	--

Response

- a. Frequency and cumulative frequency distribution plots for the maximum predicted 1-h SO₂ concentrations outside or near the Project property line (PPL) are provided in [Figures 31-1, 31-2, 31-3](#) and [31-4](#) for the Baseline, Project Only, Application and Cumulative Assessment cases, respectively. The number of hours per year for each concentration range are shown above the bars.

Frequency and cumulative frequency distribution plots for the maximum predicted 24-h SO₂ concentrations outside or near the Project PPL are provided in [Figures 31-5, 31-6, 31-7](#) and [31-8](#) for the Baseline, Project Only, Application and Cumulative Assessment cases, respectively. The number of days per year for each concentration range are shown above the bars.

32	<p>Volume 2, Section 2.9.9, Page 2-120</p> <p>The discussion on visibility does not address 'visibility' only visual blight in reference to plume height.</p>
	a. Provide a discussion on the baseline regional visibility conditions (visible path length). Include a discussion on loadings in the region impacting visibility.
	b. What are the project's impacts or changes on this baseline visibility?
	c. Provide possible mitigation measures.

Response

The information in [Volume 2, Section 2.9.9](#) is a summary; it discusses both plume height and reduced ground level visibility. More visibility information is provided in [Volume 2, Section 2.7.10](#) on pages [2-79](#) to [2-81](#) and in the associated figures that are on pages [2-113](#) and to [2-115](#).

- a. Baseline visibility restrictions based on Namao airport measurements are provided on page [2-81](#) of the Application.
- b. Potential visibility issues associated with Project emissions include the following:
 - i. Upset flaring can result in a visible flame, which is more pronounced during the night and the effects can be exacerbated with a low cloud cover. In some cases, a visible plume may result from the partial combustion of the gases to the flare stack. Upset flaring events leading to visible plumes have been documented in the region (Scheider, 2007).
 - ii. Water vapour in stack combustion product plumes will condense to form visible plumes that can extend to heights of several hundred metres. Typically, visible plumes will only occur under low temperature conditions (i.e., temperatures less than -18 °C).
 - iii. Water vapour emissions from cooling towers may result in ground-level fogging under low temperature, moderate wind speed (i.e., greater than 3 m/s) conditions. The predicted values associated with the Project cooling tower plumes were discussed in the context of the baseline visibility restrictions identified in response a. above.
 - iv. Visible haze could result from primary and secondary particulate matter (PM) formation. There are no background measurements for visible plumes from the Edmonton urban area or from the Industrial Heartland emission sources.
- c. The respective mitigation measures will depend on the visibility component being addressed:
 - i. Upset Flaring: Design and operate the project to reduce the need for flaring. The redundant sulphur recovery plants can be used to reduce the need for flaring if a problem is encountered with one of the plants. Appropriate flare stack tip design and supplemental natural gas addition during flaring should increase combustion efficiency to reduce the potential for a visible plume.

- ii. There are no mitigation measures for condensation plumes. While high efficiency furnaces and boilers may reduce the amount of water vapour being released to the atmosphere, there will still be visible plumes under low temperature conditions.
- iii. The Project cooling will be handled by a mixture of air cooling systems and water cooling systems. Approximately 80% of the cooling is handled by air cooling with the remaining by water cooling. During the winter there is a shift to more cooling by air and less by water cooling. If fogging on nearby roadways or access roads is noted, appropriate warning signage will be installed.
- iv. The Project will use fuel gas which is regarded as Best Available Technology Economically Achievable (BATEA) for PM emission control, especially with properly designed and operated burners. Secondary PM formation due to SO₂ emissions will be controlled by employing a nominal 99.8% sulphur recovery design which is also regarded as BATEA. Secondary PM formation due to NO_x emissions will be controlled by adopting ultra low NO_x burner technology where technically feasible.

- Schneider, W. 2007. Visible Air Pollution in the Industrial Heartland of Alberta and Vicinity. Posted May 12, 2007, Updated May 19, 2007. Available at: <http://folc.ca/IH/air-pollution.htm>.

33	<p>Volume 2, Section 2, Pages 2-1 to 2-124</p> <p>The air quality assessment is required to assess the relevant emissions from the facility which will include carbon monoxide (CO). CO was assessed in terms of the project alone (Appendix 2E) but results have not been presented for the Baseline, Application or Cumulative Effects Assessment scenarios.</p> <p>a. Provide the modeling results in tabular and graphical format for all three scenarios and provide a summary of the CO environmental impact assessment.</p>
----	---

Response

- a. Carbon monoxide (CO) concentrations due to Project emissions are presented in [Table 2E-4 of Volume 2, Appendix 2E](#). The predicted values were 20 (8-h) and 45 (1-h) times less than the respective Alberta Ambient Air Quality Objectives (AAAQOs) for CO. In addition, the maximum values in Fort Saskatchewan were well below the respective AAAQO for CO. For this reason, the CO predictions were not provided in the air quality assessment, even though they were calculated and provided to the Human Health Risk Assessment (HHRA).

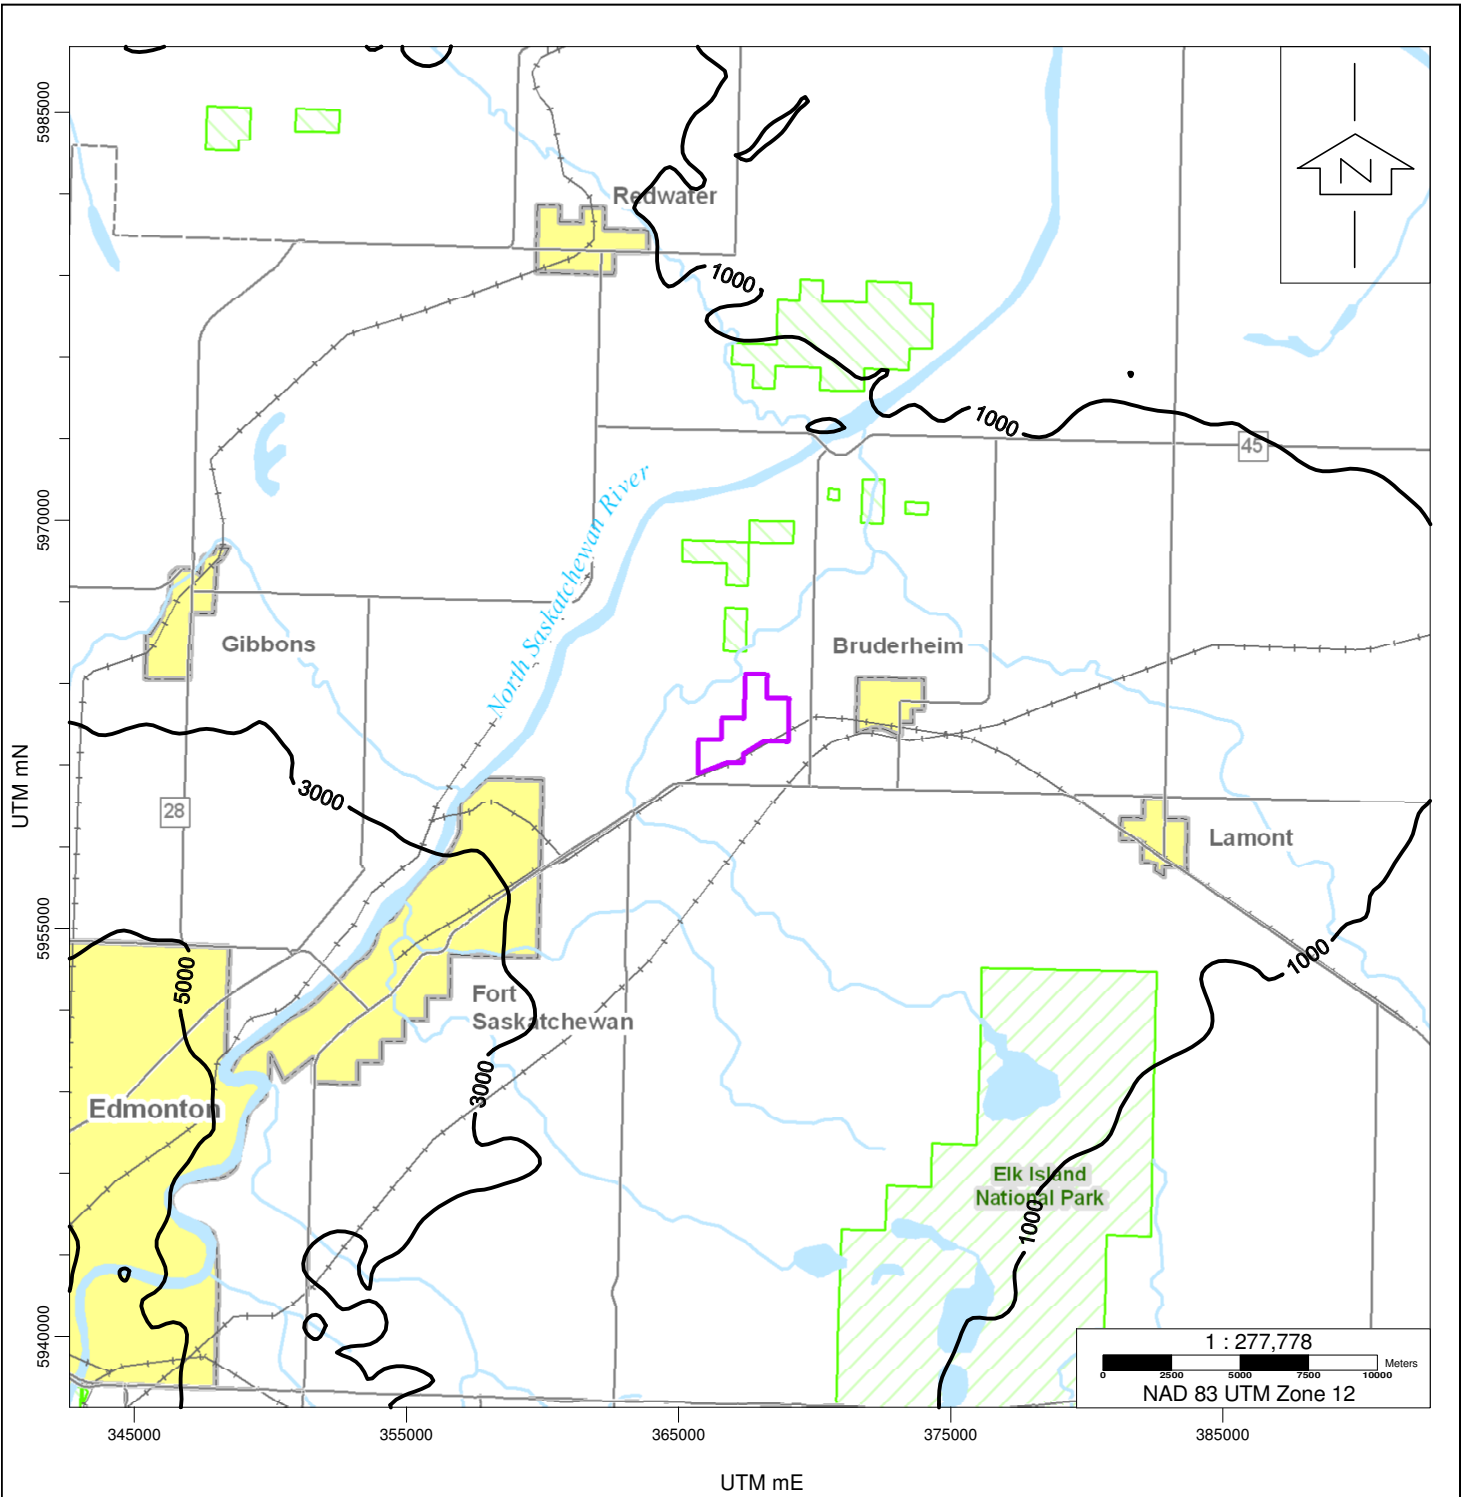

The maximum predicted 1-h and 8-h CO concentrations associated with Baseline, Application and Cumulative Assessment cases are provided in [Table 33-1](#). For all cases, the maximum predicted 1-h CO concentration is less than the 1-h AAAQO of 15,000 ug/m³. Similarly, the maximum predicted 8-h CO concentration is less than the 1-h AAAQO of 6,000 ug/m³.

The predicted 1-h CO concentrations are provided in [Figures 33-1, 33-2 and 33-3](#) for the Baseline, Application and Cumulative Cases, respectively. The predicted 8-h CO concentrations are provided in [Figures 33-4, 33-5 and 33-6](#) for the Baseline, Application and Cumulative cases, respectively. All figures show the urban influence.

34	Volume 2, Section 2, Appendix 2E There appears to be some significant differences between the SCREEN3, ISCST3, and CALPUFF modeling results. For example, in some cases SCREEN3 and ISCST3 are predicting concentrations less than CALPUFF predictions.
	a. Provide detailed reasons for these apparent differences and comment on the significance of these differences.

Response

- a. The differences between the SCREEN3 and the ISCST3 model results can be attributed to the following:

SCREEN3 and ISCST3 differences: The SCREEN3 model can only account for one source at a time. The SCREEN3 model allows the user to examine the relative contribution for multiple stack facilities. The totals depicted in [Figure 2E-1 in Volume 2, Appendix 2E](#) are conservative in that the individual stack maximums are all assumed to be collated and occur at the same time. The ISCST3 model accounts for the spatial stack separation and rigorously evaluates overlapping plumes. For this reason, the ISCST3 predicted maximum values would be less than that inferred from the SCREEN3 model.

CALPUFF and ISCST3/SCREEN3 differences: The SCREEN3 and ISCST3 models are steady state plume models. Under very low wind speed conditions, a steady state plume model cannot account for the disorganized air flow that occurs under these conditions. For this reason, the minimum wind speed used in these models is 1 m/s. In contrast, the CALPUFF model treats the plume as a series of puffs. Under low wind speed conditions, the plumes can overlap leading to higher concentrations. The CALPUFF model can be, and was, applied to wind speeds less than 1 m/s. Generally, the higher concentrations predicted by the CALPUFF model are associated with wind speeds less than 1 m/s.

The SCREEN3 and ISCST3 models account for the vertical and crosswind dispersion using the Pasquill Gifford Turner (PGT) curves that treat turbulence as a discrete variable. In contrast, the CALPUFF model was applied using the similarity scaling approach which treats turbulence as a continuous variable.

These differences can influence the maximum predicted concentrations. The CALPUFF model was viewed as providing reasonable predictions when compared to the ambient measurements. Had the ISCST3 model been used, the predicted values would be less than the values indicated by the measurements. The CALPUFF model was therefore seen as an appropriate tool to evaluate the air quality changes resulting from the StatoilHydro Upgrader.

35	Volume 2, Appendix 2A, Tables 2A-19 to 2A-24, Pages 2A-40 to 2A-45
	a. Describe how NO _x emissions were calculated from the combustion sources.
	b. Provide the emission reduction technology or process that was assumed when determining NO _x emissions.

Response

- a. The NO_x levels in the flue gas are based on the achievable NO_x levels of the burners in the various heaters. All of the heaters, except for the delayed coker heaters and the tail gas treating unit (TGTU) incinerators, will have ultra low NO_x burners installed which are capable of reaching 15.04 g of NO_x per GJ (0.035 lb/mm Btu) of fired duty. Due to the size and firebox temperature in the delayed coker heaters, the burners are classified as low NO_x, only reaching 30.08 g of NO_x per GJ of fired duty. The NO_x emissions are therefore calculated by multiplying the design fired duty by the achievable NO_x level plus an additional 10% operating allowance.
- b. As indicated in the response to Part a, all of the fired heaters will be equipped with ultra low NO_x burners except for the delayed coking heaters and the TGTU incinerators which are low NO_x burners.

36	<p>Volume 2, Appendix 2A, Table 2A-20, Page 2A-41</p> <p>It is shown in this section that the Hydrogen Reformer Stack will be fuelled with plant fuel gas and PSA.</p> <p>a. Provide the overall gas composition of this combined fuel.</p>
----	--

Response

- a. The overall gas composition of the combined fuel is shown in [Table 36-1](#).

Table 36-1 Gas Composition of the Combined Plant Fuel Gas and PSA Tail Gas

Component	Tail Gas kmole/h	Fuel Gas kmole/h	Total kmole/h	Mole Fraction

37	Volume 2, Appendix 2A, Table 2A-24, Page 2A-45
	It appears that there will be a total of five 90 m incinerator stacks and 11 flare stacks.
	a. Provide Statoil's rationale for using 5 incinerator stacks.
	b. Explain if it is possible for the design of the facility to use only 1 or 2 incinerator stacks.
	c. Provide Statoil's rationale for needing 11 flare stacks.
	d. Explain if it is possible for the design of the facility to use fewer flare stacks.

Response

- a. For each tail gas treating unit (TGTU), an incinerator stack sized for the capacity of the tail gas unit is required. In Phase 1 a single incinerator stack is required for the TGTU. As the Upgrader is expanded to reach a 243,000 bpsd capacity, two further TGTUs each requiring an incinerator stack will be required.

Each of the gasification units has a TGTU, including an incinerator stack. The incinerator stacks must be located adjacent to the TGTUs. The feasibility of combining services is limited as the plant is expanded.

- b. The facility could be designed to use only two stacks but this would require pre-investment to build a single stack sized for the Project case (243,000 bpsd). The stack would need to be centrally located to each of the TGTUs to minimize piping runs. As several low pressure off gases are tied into the stack, this would introduce complications with respect to achieving an adequate pressure balance.

For the gasification units, pre-investment would be required to build a stack capable of handling the incineration from both gasification TGTUs. This stack would also need to be centrally located.

- c. There are two main hydrocarbon flares for the Upgrader (emission sources 14 and 36 on [Figure 1-1](#)) which handle emergency relief events from the major process units. There are two smaller low pressure flares (emission sources 13 and 35 on [Figure 1-1](#)) located at the tank farm. These low pressure flares are in place to manage a failure of the tank farm vapour recovery unit (VRU) and subsequent discharge of tank vapours to low pressure incineration. Tank vapours are slightly above atmospheric pressure and therefore cannot be tied in the main hydrocarbon flare header.

In the three sulphur recovery units, the sour water strippers relieve to the three acid gas flares (emission sources 12, 31 & 32 on [Figure 1-1](#)). These flares are small and are designed to handle the highly acidic, low heating value relief stream to ensure proper incineration. Some facilities tie this relief into the main hydrocarbon flare header and rely on operating procedures of sweeping, purging and steaming during and after the emergency event. At this stage in the Upgrader design, StatoilHydro has chosen to keep these two flares separate. For the Upgrader portion of the Project, there are a total of seven flares; four of which are standalone and three are acid gas flares attached to the TGTU incinerator stacks.

The two gasification stages have two flares each. Main flares (emission sources 37 and 55 on [Figure 1-1](#)) are designed to handle emergency relief events from the major gasification process units and two acid gas (or sour gas) flares (emission sources 48 and 66 on [Figure 1-1](#)) which are designed for sour water stripper relief events.

- d. As indicated in the response to [Part c](#), above, the acid gas flares could be removed and the acid gas relieved into the main flare header. Strict procedures would need to be in place to adequately purge the header after a release and to ensure proper incineration in the main flare header burner tip. As the sour water strippers operate at low pressure, special care would be required in the header sizing, tie in location and pressure safety valve choices to ensure no significant backpressure would occur which would limit the acid gas relief rate.

Pre-investment into the Phase 1 flares would also allow a reduction in the number of flares. Reducing the number of stacks would reduce the plot space and the small quantity of continuous purge/pilot gas. Capital cost savings would need to be weighed against the earlier investment costs.

38	Volume 2, Appendix 2A, Tables 2A-28 to 2A-30, Pages 2A-49 to 2A-51 Statoil identifies flare stack parameters and emissions for potential non-routine flaring events.
	a. All inlet gas streams are identified as acid gas. Confirm if this is accurate.
	b. Some of the gas streams to flare appear to contain water. Confirm if the gas composition presented is representative of the gas that is burned in the flare, or if it is the gas composition prior to knock-out tanks.

Response

- a. Yes, all of the inlet gas streams could be categorized as acid gas since they all contain some level of H₂S. However, typically only streams that originate from the sulphur recovery units are designated as acid gas due to their high levels of H₂S.
- b. The compositions shown for the flare relief case represent the gas that is relieved through the pressure safety valves (PSVs). Assuming zero drop-out in the knockout drum, these flow rates and compositions are representative of the gas that is combusted in the flare.

39	Volume 2, Appendix 2C, Table 2C-2 and 2C-10, Figure 2C-16, Pages 2C-6, 2C-31 and 2C-39
	a. In Table 2C-2, explain why the Leaf Area Index for coniferous forests is greater than for deciduous forests.
	b. In Figure 2C-16, explain why there are significantly more frequent predicted occurrences of stable conditions (PG E and F) at night in the summer as compared to the other seasons.
	c. There appears to be 10 surface stations considered for CALMET. Confirm if the value for NSSTA shown in Table 2C-10 is correct.

Response

- a. For the summer, the Leaf Area Indices (LAI) for coniferous and deciduous forests were assumed to be 5.2 and 3.4, respectively.

Brook et al. (1999) developed a dry deposition model for much of North America and provided deposition velocity estimates for different land use classes for different seasons. Their land use classes (LUC) include: #2 Broadleaf-deciduous trees, and #4 Needle leaf evergreen trees (from Table 1 in Brook et al., 1999). [Table 39-1](#) identifies the LAI values for each season for these two land use classes (from Table 4 in Brook et al., 1999):

Table 39-1 Comparison of Seasonal Leaf Area Index Values for Broad-leaf Deciduous and Needle-leaf Evergreen Trees

Season as per Brook et al.	Season as per EIA	LUC #2 (Deciduous)	LUC #4 (Coniferous)
1 Midsummer, lush vegetation	Summer	3.4	5.2
2 Fall, with non-harvested cropland	Not Used	2.0	5.2
3 Late fall, after frost, before snow	Fall	0.1	4.7
4 Winter, snow on the ground	Winter	0.1	4.5
5 Spring, transitional	Spring	1.0	5.2

These are the values that were used for the EIA and the summer LAI for coniferous forests is confirmed to be greater than the summer value for deciduous forests. In tropical areas, the LAI can be larger for broadleaf trees than for coniferous trees.

- b. Pasquill Gifford (PG) classes vary with solar input, cloud cover and wind speed. During the night, the key parameters are cloud cover and wind speed. Typically, high wind speeds (i.e., those that are 5 m/s or greater) are associated with Neutral D conditions. Measured wind speed data from the nearby Scotford and Lamont monitoring stations, and predicted wind speed data from the meteorological model for the Project site were reviewed. The findings are as follows:
- At the Lamont site, measured wind speeds greater than or equal to 5 m/s were least frequent (16%) during the summer when compared to the other seasons (22% to 44%).

- At the Scotford site, measured wind speeds greater than or equal to 5 m/s were the least frequent (20% to 21%) during the summer, fall and winter, when compared to spring (33%).
- At the Project site, predicted wind speeds greater than or equal to 5 m/s were least frequent (16%) during the summer and fall when compared to spring and winter (22% to 44%).

In conclusion, there appears to be a bias for lower wind speed during the summer. As a consequence, PG classes E and F could be expected more frequently during the night than for other seasons.

- c. The NSSTA value of 6 in [Table 2C-10 in Volume 2, Appendix 2C](#) indicates that there are six surface stations, while [Table 2C-13](#) identifies ten surface stations. The value of six is incorrect and it should be replaced with ten to reflect that all ten stations identified in [Table 2C-10](#) were used.

Reference

- Brook, J.R., L. Zhang, F Di-Giovanni, J. Padro. 1999. Description and evaluation of a model of dry deposition velocities for routine estimates of air pollutant dry deposition over North America. Part I: model development. Atmospheric Environment. 33. pp 5037 to 5051.

40	<p>Volume 2, Appendix 2D, Section 2D4.13, Table 2D-14, Page 2D-30</p> <p>The comparison of observed H₂S and modeled H₂S concentrations shows that the predicted concentrations are substantially under-predicted (an order of magnitude of ten).</p>
	<p>a. Comment on the possible reason(s) for the under-prediction. If the under prediction were entirely attributed to an under-estimate of the industrial emissions as suggested in the assessment (Section 2.5.2.2, Page 2-18, The ambient H₂S concentrations are associated with fugitive industrial emission sources.) then the expected concentrations in those industrial areas would increase an order of magnitude or factor of ten. In this case, comment on the increased possibility and frequency of odours in Residential/Community, Public Access areas or Commercial areas (see Table 2.7-24 were concentrations are already in excess of odour levels).</p>
	<p>b. What operation strategies or design changes will Statoil implement to prevent odours? Provide supplemental modeling in support of the changes as appropriate.</p>

Response

- a. While stack emissions may remain relatively constant with time, fugitive emissions can vary considerably with time. For example, Murphy and Allan (2005) reported that daily average fugitive emissions in the Houston-Galveston area can vary from annual average emissions by multiple orders of magnitude. They found that 75% of the non-routine emission events were 24-h or less in duration, 25% were 1-h or less in duration, and 11% were 10-minutes or less in duration. While their study focussed on fugitive volatile organic compounds (VOC) emissions, the findings are also applicable to fugitive H₂S emissions.

The underpredictions may in part be due to the variable nature of fugitive emissions. It is also likely due to not including all potential H₂S emissions sources in the baseline modelling. As indicated on [page 2B-30 of Volume 2, Appendix 2B](#), correlating the high H₂S concentrations with wind direction indicates some of the high H₂S emissions may be due to small regional oil and gas field operations.

It is interesting to note that the highest predicted H₂S concentration at the Scotford monitoring site is 5.08 ug/m³ ([Volume 2, Appendix 2D, page 2D-30](#)). The maximum and 99.9th percentile H₂S measurements at the Scotford site for 2006 are 11.1 and 5.6 ug/m³, respectively. The agreement between the 99.9th percentile measured and the maximum predicted indicates that the model is giving an indication of high concentrations that could occur.

Given the challenge in estimating fugitive H₂S from existing and future sources, the air quality assessment flagged fugitive H₂S emissions as a potential concern for facilities that handle gas streams containing H₂S. It is for this reason, that a number of initiatives have been indicated for consideration:

- Vapour recovery on storage tanks carrying sour product ([page 2-21](#))
- Implementation of a leak detection and repair (LDAR) program ([pages 2-21 and 2-117](#))

- Measurement of reduced sulphur compound in the SRU/TGTU flue gas ([page 2-116](#))

As a result of these findings, StatoilHydro plans to explore ways to manage and control fugitive H₂S emissions during the design and operation phase. StatoilHydro will also have an odour response plan to quickly identify off-site odours so that the source of the odour and mitigation can be addressed in a timely manner (as described in [SIR Response 138b](#)).

Reference

Murphy, C.F. and D.T. Allen. 2005. Hydrocarbon emissions from industrial release events in the Houston-Galveston area and their impact on ozone formation. *Atmospheric Environment* 39. Pp 3785 to 3798.

- b. Odours typically arise from fugitive emissions from storage tanks, sewers, rotating equipment seals, flanges, etc. StatoilHydro has given particular attention to controlling fugitive emissions at the design stage by specifying closed process sewers and sampling systems, high performance pump seals, vapour controls on the storage tanks, and connecting compressor seal vents and pressure relief devices to flare systems.

StatoilHydro is committed to managing its fugitive emissions through a variety of proactive measures including:

- 100% standby vapour recovery units in the tank farm;
- application of current design standards and best management practices; and
- implementation of a formal leak detection and repair (LDAR) program; and
- predictive maintenance techniques.

StatoilHydro will continue to pay close attention to the management of fugitive sources throughout the life of the facility and will modify and optimize its monitoring programs and management practices as needed.

41	Volume 2, Appendix 2D, Table 2D-19, Page 2D-37 It appears from Table 2D-19 that NO, NO ₂ , and NO _x were all assumed to be emitted and modeled.
	a. Explain how the results of this modeling were used in the assessment.

Response

- a. The following explains the processing path with respect to NO_x emissions:
- i. The NO_x emission rates were obtained from the design engineers for each combustion source associated with the Project, and from emissions inventory data for other facilities.
 - ii. NO and NO₂ emission rates were calculated by assuming 90% and 10% of the NO_x emissions, respectively.
 - iii. The CALPUFF model was used to calculate ambient NO, NO₂ and NO_x concentrations.
 - iv. The NO and NO₂ concentrations were used internally by the CALPUFF model to calculate the contribution to PAI deposition and nitrogen deposition.
 - v. The NO_x concentrations predicted by the CALPUFF model were post processed using the ozone limiting method (OLM) described in [Volume 2, Appendix 2D, Section 2D3.6](#) to obtain the hourly NO₂ concentrations. Hourly average ozone measurements from the Lamont station were used for this purpose.

42	<p>Volume 2, Appendix 2E, Section 2E1.4, Page 2E-4</p> <p>The Project Property Line (PPL) is used to define the limits for applicability of AAAQO.</p> <p>a. Confirm that the PPL will be fenced to prevent public access and moderate the control of environmental receptor access.</p> <p>b. Confirm that the preservation area (¼-section to the north) will not be fenced, thus allowing both public and environmental receptor access.</p>
----	--

Response

- a. Access to the processing areas of the Upgrader site will be controlled with a fence. In addition to the fence, StatoilHydro proposes to have security personal to monitor activity within the perimeter of the operation.
- b. At this time, StatoilHydro does not have any plans to restrict public and wildlife access to SE 2 56-21-W4M. [SIR Response 52](#) provides more detail.

43	<p>Volume 2, Appendix 2E, Figure 2E-10, Page 2-16</p> <p>The figure for 8-Hour CO appears to be incorrect since the concentrations are similar to Figure 2E-9 (1-hour CO). Further, the figure shows a zone where the 8-hour CO concentrations are greater than AAAQO, this is inconsistent with Table 2E-4.</p> <p>a. Confirm and comment on the CO concentration predictions. Provide an updated table and/or figure as appropriate.</p>
----	---

Response

[Figure 2E-9](#) in [Volume 2, Appendix 2E](#) shows the maximum 1-h CO concentrations, and [Figure 2E-10](#) shows the maximum 8-h CO concentrations. The concentration contours for the two figures are not similar. For [Figure 2E-9](#), the 1-h concentration contours are 2.5, 5, 10, 25, 50, 100 and 250 $\mu\text{g}/\text{m}^3$. For [Figure 2E-10](#), the 8-h concentration contours are 2.5, 5, 7.5, 10, 25, 50, 75, 100 and 150 $\mu\text{g}/\text{m}^3$ (The contour numbers did not show on the figures). The red contour shown in [Figure 2E-10](#) represents the 150 contour and should not have been in red. The red colour has been used in the figure to depict a contour that is equal to the AAAQO. This is not the case for the 8-h concentration figure.

44	<p>Volume 2, Appendix 2E, Section 2E1.5, Table 2E-5, Page 2E-19</p> <p>a. The modeling predictions indicate that two of the emergency flaring scenarios show exceedances of the AAAQO. What operation strategies or design changes will Statoil implement to help ensure these two scenarios are avoided where possible?</p> <p>b. The maximum (peak) concentrations for the scenarios for some time frames result in the possibility of hazardous SO₂ concentrations (in excess of 3600 ug/m³). What operation strategies or design changes will Statoil implement to avoid flaring for these durations (each case)?</p>
----	--

Response

- a. The two emergency flaring scenarios described in Part a relate to blower failure in the Upgrader sulphur recovery units (SRUs) with subsequent shutdown of these units. There are two SRUs in Phase 1, each sized for 75% of the plant sulphur capacity and another three SRUs are added in the Project case.

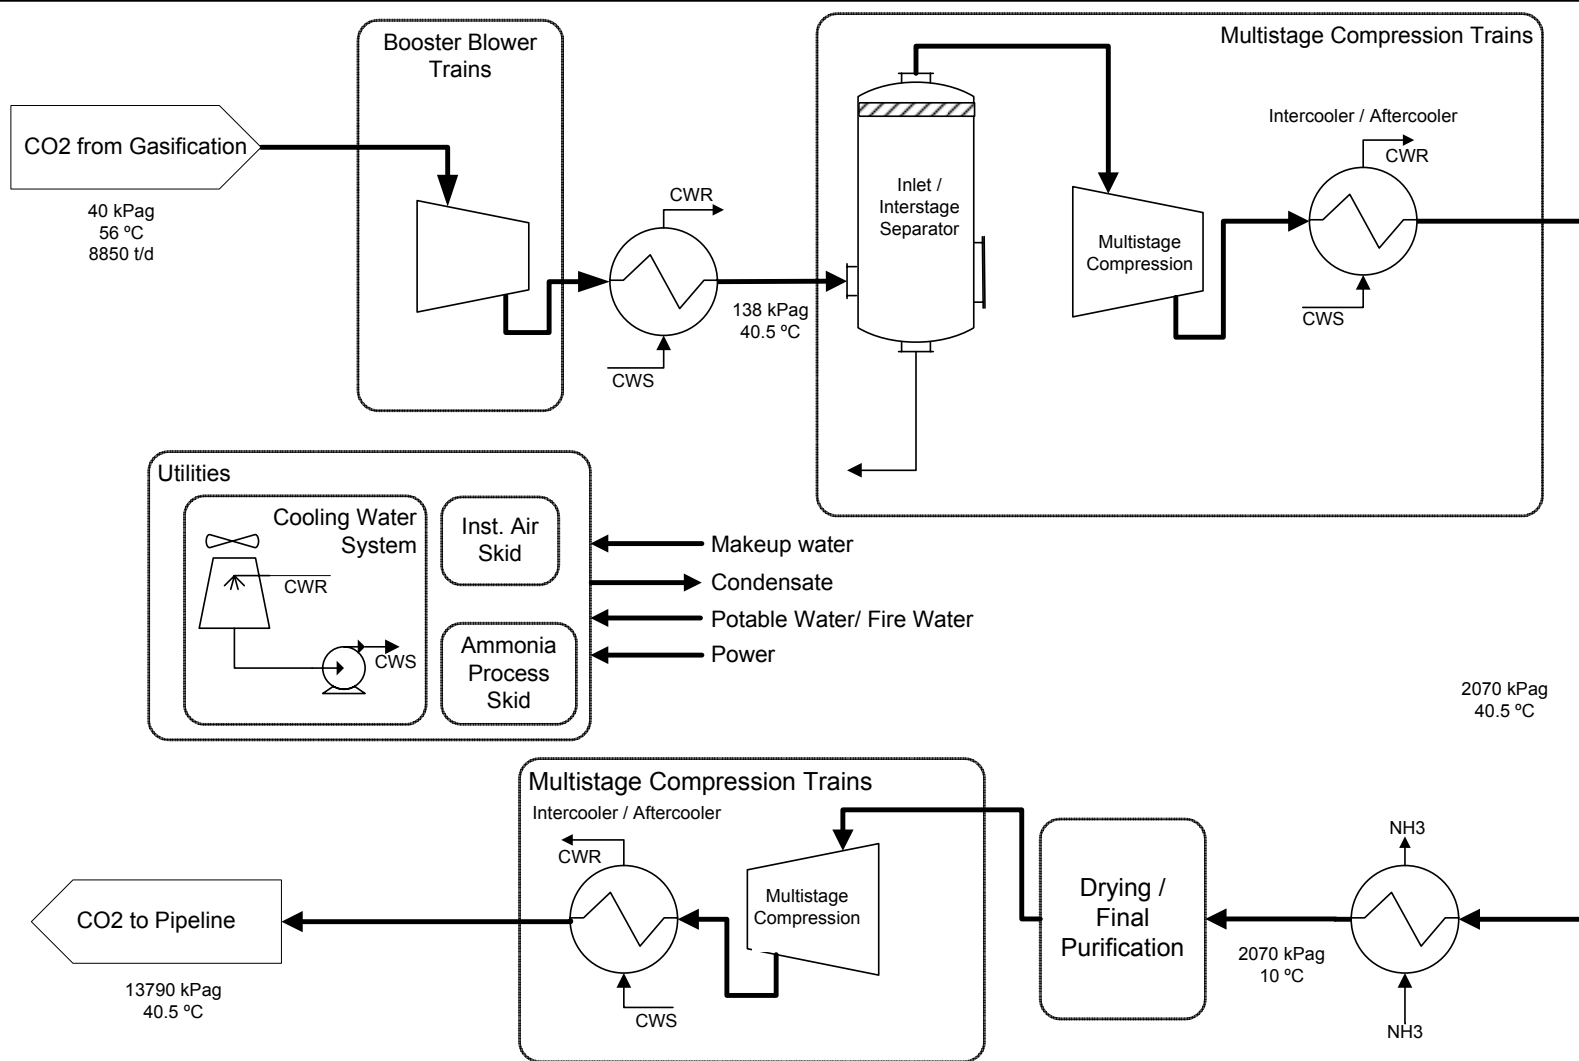

During these emergency flaring scenarios, the overheads from the amine regeneration are assumed to be relieved to the hydrocarbon flare. Emissions modelling for the environmental impact assessment assumed a very conservative, highly improbable case with two blowers failing at the same time. During normal operation, the acid gas is split evenly between the SRUs. If one SRU experiences operating problems, it will be shut down and the remaining SRUs will be ramped up to full capacity. The controlled release rate to the flare is therefore a fraction of that modelled in the application. Any release to the flare will start to diminish quickly as feed rates to the hydroprocessing units are reduced. In addition, the blowers are steam driven, with 100% electric standbys with auto start controls.

- b. Question 44b is answered in the response to Part a.

45	<p>Volume 1, Sections 1.5.2 and 3.5.3.6, Figure 3.3-2, Tables 3.2-1, 5.2-2 and 5.2-3, Pages 10, 20, 23, 38, and 75 and Volume 2, Sections 2.6.2.2, 2.7.8.3, and 2.7.8.4, Table 2.7-26, Pages 2-23, 2- 24, 2-75 and 2-76</p> <p>Statoil states <i>Gasification generates substantial CO₂ emissions, but most of these emissions can be readily recovered for carbon sequestration. Further, when gasification is implemented, water requirements will increase significantly. Actual implementation of the gasification stages, though, will be dependent primarily on it being the most viable option for providing an energy alternative to natural gas, and the most effective way of recovering the additional CO₂ emissions associated with alternative fuels. If North American implements gasification in the Project, it will be accompanied by development plans for CO₂ recovery, transportation, and storage/sequestration. Statoil plans but does not commit to gasification and CO₂ capture.</i></p>
	<p>a. Provide an update on Statoil's decision to implement gasification and CO₂ capture.</p>
	<p>b. If gasification and CO₂ capture is implemented provide the following:</p> <ul style="list-style-type: none"> i) Updated Project Process Flow Diagram (include CO₂ capture and product stream); ii) Process and equipment for CO₂ capture and compression; iii) Source of the CO₂ stream for capture; (45-3) iv) Description of the effects of CO₂ transportation and storage/use on both Greenhouse Gas (GHG) and criteria air contaminant emissions as required in the Terms of Reference (3.6.1e); v) Updated versions of Figures 5.2-1, 5.2-2 and Tables 3.2-1, 5.2-2, and 5.2-3 as necessary;
	<p>c. If gasification is not implemented provide the following:</p> <ul style="list-style-type: none"> i) Contingency plan for expanding hydrogen production by Steam Methane Reformation (SMR) of natural gas should gasification not proceed, as required in the Terms of Reference (2.2c); ii) A discussion on how using SMR instead of gasification could increase the emission rates stated in Section 2.6.2.2 and the impact assessment in Section 2.7; iii) Estimated GHG emissions from the Project in the event that SMR is used instead of gasification. Update Table 2.7-26 accordingly.

Response

- a. StatoilHydro's position on gasification remains unchanged. If these units are constructed, StatoilHydro intends to be ready to recover a substantial portion of the resulting CO₂ produced.
- b.
 - i) and ii) Updated process flow diagram (include CO₂ capture and product stream) are provided in [Figures 5-1](#) and [45-1](#).
 - iii) [Figure 45-2](#) presents a schematic of the CO₂ source stream for capture.

iv) CO₂ Compression and Transportation

Power requirements associated with compression for CO₂ capture and transportation will result in additional greenhouse gas and criteria air contaminant emissions. The details of third party CO₂ pipeline and storage facilities are not known at this time. [Table 45-1](#) lists the requirements to compress the CO₂ from both gasification stages to an off-site CO₂ pipeline. StatoilHydro expects the compression facilities to be electrically driven.

Table 45-1 Preliminary On-site CO₂ Compression Requirements

Item	Gasification 1	Gasification 2
CO ₂ (t/d)	8853	7230
CO ₂ purity	99%	99%
Suction Pressure (kPag)	40	40
Discharge Pressure (kPag)	14,000	14,000
Power consumption (MW)	57.4	47.0
Compressor Type	Multi stage centrifugal	Multi stage centrifugal
Brief Description	6 stages of compression, then drying followed by 2 stages of booster compression	6 stages of compression, then drying followed by 2 stages of booster compression
Footprint (m)	60 x 40	60 x 40

v) [Volume 1, Figures 5.2-1](#) and [5.2-2](#) already show the CO₂ stream and therefore do not need to be updated. [Tables 3.2-1, 5.2-2](#) and [5.2-3](#) are updated as [Tables 45-2](#) to [45-4](#).

Notes:

- 1 Steam produced is used to generate electrical power through a condensing turbine.
- 2 These values are revised from Application. All other values are the same as presented in the Application.

- c. i) If StatoilHydro decides not to implement gasification then the source of additional hydrogen would come from a third party supply or from additional steam methane reformer (SMR) units. Early discussions with potential third party suppliers are underway. Additional SMRs have been studied and their capacity and staging are very much dependent on the project phases. As a conservative position StatoilHydro has assumed that two additional SMRs will be required (110 and 70 mm SCFD) along with a minor expansion of the Phase 1 SMR to 116 mm SCFD.
- ii) [Table 45-5](#) describes the emission source coordinates and loads with steam methane reformers (SMRs) in place of Gasification. Emission sources with SMRs in place of Gasification.

Table 45-5 Steam Methane Reformer Emission Parameters

Exhaust Parameters				
Exit Velocity	m/s	15.27	15.27	15.27
Exit Temperature	C	138	138	138
Exit Temperature	K	411	411	411
Emission Rate				
SO ₂	t/d	0.0041	0.003	0.0040
NO _x	t/d	0.352	0.274	0.343
CO	t/d	0.302	0.235	0.294
VOC	t/d	0.030	0.023	0.029
PM _{2.5}	t/d	0.071	0.055	0.069

Table 45-6 compares the projected emission rates for the majority of criteria air contaminants (CACs) from the Upgrader with Gasification (as evaluated in the EIA) with those from the Upgrader without gasification. As shown in Table 45-7, there is a large decrease in SO₂ emissions without gasification because all Upgrader hydrogen is produced from low sulphur natural gas versus high sulphur petcoke. This decrease in SO₂ emissions will reduce SO₂ PPL concentrations and contribute to a decrease in regional PAI. For the other CACs listed in Table 45-6, there is a general increase in emissions of about 20% compared to the gasification option. Although these emissions increase, the relatively small increase relative to the airshed is not anticipated to affect the conclusions of the impact assessment.

Table 45-6 Predicted Emission Rates With and Without Gasification

Substance	Average Period	Project With Gasification	Project Without Gasification	Percent Change in Emissions
SO ₂ (t/d)	1-h	18.13	14.32	-21.7
	24-h	18.13	14.32	-21.7
	Annual	7.34	5.83	-20.5
NO ₂ (t/d)	Annual	3.02	3.53	+16.9
PM _{2.5} (t/d)	Annual	0.41	0.55	+22.0
CO (t/d)	Annual	2.36	2.82	+19.5
Total VOC (t/d)	Annual	0.25	0.29	+16.0

- iii) [Table 45-7](#) - Case 3 below shows the GHG emissions for the project with SMR's to produce the required hydrogen in place of gasification. No CO₂ recovery is assumed for this case although there is the potential to recover 35% of the GHG for this case should the CO₂ recovery and transportation infrastructure be in place.

Table 45-7 (Table 2.7-26 Revised) Estimated Operations GHG Emissions for the Project with SMRs in place of Gasification

Project Case and Source	CO ₂	CH ₄	N ₂ O	CO ₂ e
Case 1: Without CO₂ Recovery from Gasification				
Fuel Combustion (t/d)	8,082	0.16	0.14	8,129
Fugitive Emissions (t/d)	31	1.00	0.00	52
Petcoke Gasification Vents (t/d)	16,083	0.00	0.00	16,083
Emission Rate (t/d)	24,196	1.16	0.14	24,197
Annual Emission Rate (kt/y)	8,832	0.42	0.05	8,832
Case 2: With CO₂ Recovery from Gasification				
Fuel Combustion (t/d)	8,082	0.16	0.14	8,129
Fugitive Emissions (t/d)	31	1.00	0.00	52
Petcoke Gasification Vents (t/d)	0	0.00	0.00	0
Emission Rate (t/d)	8,113	1.16	0.14	8,114

Case 3: With SMR's in place of Gasification				
Fuel Combustion (t/d)	8,082	0.16	0.14	8,129
Fugitive Emissions (t/d)	31	1.00	0.00	52
Additional SMR's (t/d)	4,303	0.07	0.08	4,329
Emission Rate (t/d)	12,416	2.23	0.22	12,510
Annual Emission Rate (kt/y)	4,532	0.81	0.08	4,566

NOISE

46	Volume 2, Section 3.4.3.1, Page 3-10 and Appendix 3F Statoil states <i>The baseline case models conditions present during the baseline noise measurements... This was done to provide a means of model calibration with the modeled sound levels...</i> From the weather data presented in Appendix 3F it appears that during both monitoring events upwind conditions were present as well as high wind events (causing data exclusion) for a majority of residences monitored.
	a. Explain how the model was calibrated to predict downwind propagation conditions when upwind baseline noise measurements were taken and justify how the model accurately represents the current noise conditions at the specified residences.
	b. Describe the <i>ambient adjustment based on noise monitoring results</i> Statoil refers to in Section 3.4.3.1 .

Response

- a. The weather data presented in [Volume 2, Appendix 3F](#) indicates that there were periods of upwind, crosswind, and downwind conditions for all receptors relative to the major noise sources nearby. In addition, although there were brief periods in which the noise levels were adjusted due to high winds, the amount of remaining data was at least 3 hours which is sufficient (in accordance with Energy Resources Conservation Board Directive 038) to determine the noise levels during downwind conditions for the receptors. Details of the impact of the weather conditions on the individual monitoring location results were provided in [Volume 2, Section 3.5.2](#).
- b. The baseline noise monitoring data (with the appropriate weather conditions) were used to partially modify the noise model results for the Baseline Case to more closely match the baseline noise monitor results. This is the method by which the noise monitoring data were used as a calibration method for the model.

47	Volume 2 Sections 3.4.3.3 and 3.6.2 Pages 3-11 and 3-21, and Appendix 3E Statoil states <i>Appendix 3E provides a detailed list of the site equipment, associated sound levels and proposed noise mitigation measures. Also, Section 3.6.2 states ...the limitation imposed by North American on the equipment supply vendors that the noise levels not exceed a maximum of 85 dBA at a distance of 0.9m. As indicated in Appendix 3E, this limitation will substantially lower the sound levels of most noise sources compared to the un-attenuated sound levels.</i>
	a. Of those <i>mitigation required</i> described in Appendix 3E , which were incorporated into the Application Case noise model, and of those, which is Statoil committed to implement.

Response

- a. All of the noise sources associated with the Project were modeled with a maximum sound pressure level of 85 dBA @ 0.9 m as indicated in [Volume 2, Section 3.6.2](#) and [Appendix 3E](#) (last column in the tables for StatoilHydro noise sources).

The modelled noise levels presented in the tables in [Appendix 3E](#) are the typical un-mitigated noise levels for the equipment listed. These unmitigated noise levels are based on various sources including field measurements, text-book calculations, and information obtained from other environmental impact assessment (EIA) noise submissions for similar projects. The unmitigated noise levels are presented for information purposes only and are intended to provide an indication of the approximate relative level of mitigation that will be required of the equipment supply vendors. It is not a specific indication of the exact noise mitigation required.

StatoilHydro will procure equipment that meets the corporate requirement of 85 dBA @ 0.9 m.

48	<p>Volume 2, Section 3.7, Pages 3-25 to 3-31 Both the <i>Approved + Proposed</i> as well as the <i>Application Case</i> includes baseline noise contributions. Therefore, the noise contributions for the facility alone are not provided in the Noise Impact Assessment (NIA).</p> <p>a. Resubmit the resulting noise levels to display the information as seen in the table below (all values must be in dBA):</p> <p style="text-align: center;">Noise Contribution Table Outline for Each Resident</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 20%;">Column 1</th> <th style="width: 20%;">Column 2</th> <th style="width: 20%;">Column 3</th> <th style="width: 20%;">Column 4</th> <th style="width: 20%;">Column 5</th> </tr> </thead> <tbody> <tr> <td>Background Measured Nighttime CSL (without isolation analysis performed)</td> <td>Permissible Nighttime Sound Level (PSL)</td> <td>Baseline/Existing Facility Nighttime Sound Level</td> <td>Proposed StatoilHydro Noise Contributions</td> <td>Proposed StatoilHydro Contributions + Baseline (Column 4+3)</td> </tr> </tbody> </table> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 20%;">Column 6</th> <th style="width: 20%;">Column 7</th> <th style="width: 20%;">Column 8</th> <th style="width: 20%;">Column 8</th> <th style="width: 20%;">Column 9</th> </tr> </thead> <tbody> <tr> <td>Noise Contributions from Approved Facilities not Operating</td> <td>Current Noise Level in the Area (Column 5+6)</td> <td>Predicted Noise Contributions from Other Planned Facilities</td> <td>Total Noise Contributions for the Area (Column 7+8)</td> <td>Predicted Noise Contribution Compared to PSL (Column 2-8)</td> </tr> </tbody> </table>	Column 1	Column 2	Column 3	Column 4	Column 5	Background Measured Nighttime CSL (without isolation analysis performed)	Permissible Nighttime Sound Level (PSL)	Baseline/Existing Facility Nighttime Sound Level	Proposed StatoilHydro Noise Contributions	Proposed StatoilHydro Contributions + Baseline (Column 4+3)	Column 6	Column 7	Column 8	Column 8	Column 9	Noise Contributions from Approved Facilities not Operating	Current Noise Level in the Area (Column 5+6)	Predicted Noise Contributions from Other Planned Facilities	Total Noise Contributions for the Area (Column 7+8)	Predicted Noise Contribution Compared to PSL (Column 2-8)
Column 1	Column 2	Column 3	Column 4	Column 5

Noise Contributions from Approved Facilities not Operating	Current Noise Level in the Area (Column 5+6)	Predicted Noise Contributions from Other Planned Facilities	Total Noise Contributions for the Area (Column 7+8)	Predicted Noise Contribution Compared to PSL (Column 2-8)																	

Response

- a. The requested information regarding noise contribution by resident is presented in [Table 49-1](#) and [Table 49-2](#) for Group 1 and Group 2 receptors, respectively. Rail traffic on the Project site has been included in the noise model (see [SIR Response 49](#)).

49	<p>Volume 2, Section 3.7.3.2, Page 3-29</p> <p>Statoil does not address the potential impact of railway traffic within the project site boundaries in the overall noise levels for the Operating Case. Rail traffic within the project boundaries is considered operational noise and needs to be incorporated into the subsequent noise model.</p> <p>a. Resubmit the model to include the noise contributions associated with operational rail traffic.</p>
----	--

Response

- a. Rail traffic within the project boundaries has been included as a noise source in the model. The modelled results presented [SIR Response 47](#) reflect this additional noise source. The impact of the rail traffic was an increase of 0.3 dBA at the closest receptor location with other locations further away having less of an increase and most locations having an increase less than 0.1 dBA relative to the noise levels without the rail traffic. This results because the noise associated with the rail traffic is lower than the noise associated with the other stationary project equipment.

Rail traffic data used in the model included the following:

- 100 rail cars per day (modelled during the night-time period for conservative results).
- Track speed of 30 km/h (since the trains will either be slowing to a stop or just starting to move from a stop).

TERRESTRIAL

50	Volume 1, Section 3.1, Figure 3.1-2, Page 18 Statoil identifies water retention ponds and raw water ponds. a. Discuss the end land use and reclamation plan associated with these proposed ponds.
----	--

Response

- a. The end land use for those ponds will be the same as the reclamation target land use surrounding them, which is agricultural.

Reclamation will involve:

- Testing of sediments, and soil below pond bottoms, for potential contaminants with respect to the *Alberta Tier 1 Soil and Groundwater Remediation Guidelines* (AENV 2007) and appropriate disposal/treatment, or re-use if criteria are met.
- Removal and appropriate disposal of liners where present (e.g., raw water ponds).
- Any decompaction required at any point during reclamation will be carried out.
- During reclamation re-contouring and grading, surrounding berms and ditches will be removed and graded subsoil used to fill in the excavations.
- As part of the final reclamation grading, the surface form of the pond areas will integrate with the immediately surrounding areas.
- At the same time as for the surrounding area, salvaged subsoil will be replaced, followed by salvaged topsoil replacement with any preparation (e.g., discing) carried out as needed.
- Revegetation, monitoring and erosion/weed control will be carried out as per the surrounding area.

51	Volume 1, Section 6.3, Page 90 Statoil states <i>Following closure and reclamation, the total area of natural or semi-natural terrestrial vegetation will be reduced in area by 1.6 ha.</i>
	a. Provide a map depicting the locations of the lost area as well as further detail and rationale as to why there will be a reduction of natural or semi-natural vegetation.

Response

- a. A reduction in the area of natural and semi-natural vegetation in the LSA is predicted to occur due to the removal of vegetation during construction. [Volume 4, Section 10.6.1.1, Figure 10.6-1](#), shows the location of the reduced areas of terrestrial vegetation. The Mixed Shrubland that will be removed occurs in the south-east corner of the LSA above the curved section of railway track (SW 36-55-21-W4M). Also, an isolated fragment of Deciduous Woodland will be removed on the south boundary of the LSA on the north side of the railway track (NE 26-55-21-W4M). Because these habitats occur as very small isolated fragments, it was not considered necessary to reclaim these areas to similar habitats at closure. The 1.1 ha of Deciduous Woodland that will be lost ([Volume 4, Section 10.6, Table 10.6-1](#)) may also include a small percentage of the Deciduous Woodland on the north boundary of Section 35 (NE 35-55-21-W4M). However, most of this woodland is not under the project footprint and is not expected to be affected.

The dewatering of Class I, II and III Wetlands will also result in a reduction in the area of natural or semi-natural vegetation in the LSA.

52	Volume 1, Sections 7.6.1.5 and 11.6.2.1, Pages 11-66, 11-67 and 104 Clarify if Statoil has developed a management plan and/or has intentions to enhance the preserved wetlands and habitat area. Provide any available details.
----	---

Response

StatoilHydro's Wetland Management Plan is not yet complete. StatoilHydro will develop a Wetland Management Plan in consultation with Alberta Environment based on applicable policies and guidelines. Alberta currently has a draft *Provincial Wetland Restoration/Compensation Guide* (February 2007) and a more recent draft *Alberta Wetland Policy* (June 2008) as recommended to the Alberta Water Council. As noted in the Wetland Policy Implementation Plan (June 2008), the Alberta Wetland Policy will replace previous interim Alberta policies after approval by the Government of Alberta. StatoilHydro will proceed with development of a Wetland Management Plan after Alberta policy is clarified.

StatoilHydro will retain ownership of the North Wetland Complex and has no intentions for development in this area. The wetland will be excluded from the Project security fence allowing easy access for wildlife. Surface waters collected from the Project site will be sampled prior to discharge into the wetlands. In the event the water quality is unsuitable for release into the wetlands, the water will be routed to the waste water treatment facility. The wetlands will be designated as a non-hunting area thus providing a safe refuge for wildlife during hunting season.

53	<p>Volume 1, Section 7.6.2.3, Page 108</p> <p>Statoil states <i>Salvaged topsoils and subsoils will be stored in berms on the property.</i></p> <p>a. Discuss the stockpile design details (e.g., volume, maximum pile heights, slopes and size).</p> <p>b. Provide a map showing where the topsoil and subsoil will be stored.</p> <p>c. Confirm that Statoil's proposed footprint can accommodate these stockpiles as well as the proposed operations.</p> <p>d. Discuss the length of time that topsoil and subsoil will be stored, and the associated potential impacts to the soils and seed bank viability as a result of the duration of storage.</p> <p>e. How will Statoil ensure the volumes of the stockpiles are maintained during operation?</p> <p>f. What mitigations will Statoil have in place in the event of excessive soil loss during the operations of the facility?</p> <p>g. Discuss any alternative soil conservation options Statoil has considered as opposed to long term soil stockpiles.</p>
----	---

Response

- a. Salvaged topsoil and subsoil will be salvaged and stored separately. A portion of the salvaged soil will be utilized for a sight and sound berm around the perimeter of the property. The berm will be approximately 6 m high, with a width of 40 m across the bottom and 5 m across the top, and will have side-slopes ranging from 3 to 1 to 4.5 to 1. Salvaged subsoil will be stored in a separate subsoil stockpile located in the northeast corner of the site; the stockpile is expected to be approximately 8 m high, with a length of 360 m across the bottom, and will have slopes of 3 to 1. Salvaged subsoil may also be used as backfill material on the site or as berm material, if required. Soil salvage, berm and stockpile volume estimates are based on the proposed areas to be stripped, the proposed soil salvage strategy, and the current soil point data and facility layout. Actual soil salvage and storage volumes may vary according to actual soil stripping adjusted for any additional soil data collected, field supervision of stripping depths and soil quality, and adjustments to facility layouts. Non-disturbance of SE 2-56-21-W4M will be maintained. [Figure 53-1](#) illustrates the proposed locations of the berms and stockpile on the project footprint.
- b. See [Figure 53-1](#).
- c. Topsoil will be salvaged from all areas undergoing surface disturbance by Project construction and development activities. Topsoil will be salvaged in an upper lift to a maximum of 20 cm or to colour change. Salvage of subsoils with glaciolacustrine or till parent material will include the top 20 cm of the upper subsoil (including Bm, Bt and Btg). Due to the large volume of topsoil on-site, greater subsoil stripping depths are not required to effectively restore equivalent land capability to the area. Sandy subsoil will not be salvaged because the upper and lower subsoil are so similar in their physical properties that salvaging of the upper subsoil is not required to ensure adequate restoration of soil properties at reclamation. Subsoil will only be stripped from those areas undergoing surface disturbance in areas of anticipated risk for soil degradation. Areas with low risk to subsoil contamination such as the laydown area

south of the raw water pond, much of the area associated with the gasification units and the areas south of the rail tracks will not be subject to subsoil salvage. StatoilHydro will continue to work with Alberta Environment to refine its soil handling and storage plans.

[Figure 53-1](#) illustrates the proposed locations of the berms and stockpile on the project footprint.

- d. Progressive reclamation is proposed for the site; therefore, some portions of the site will be reclaimed during the operational phase when they are no longer needed (e.g., landscaped portions, temporary workspace used during construction, pipelines – see [Volume 1, Section 7.6.3.4](#)). Thus, some areas may have salvaged soil replaced after only a few years. For much of the plant site, the salvaged soil will be stored much longer; the lifespan of the plant is approximately 50 years. Reclamation experience with cultivated soils in the White Area has indicated that sites with salvaged soil stored over several decades can be successfully reclaimed (i.e., these areas have received Reclamation Certificates). Successful reclamation has sometimes involved using amendments such as manure. The document, *Review of Revegetation Practices for Oil and Gas Disturbances in Western Canada* (Feb. 2001; submitted by AMEC Earth & Environmental Ltd. submitted to Petroleum Technology Alliance of Canada) lists potential impacts of storage on salvaged soils, but states that in general topsoil storage, specifically in stockpiles, has not had severe or long-term effects on topsoil quality. The viability of the seed bank is not a concern as cultivation is the targeted end-land use for soils, and seeding for agronomic crops suitable for the area will be carried out at reclamation. There may be some benefit to long-term storage of weed seeds in the topsoil stockpiles as these may become non-viable over the time.
- e. Salvaged soil will be seeded to an appropriate agronomic seed mixture in order to prevent loss of salvaged soil by erosion. Other additional measures to prevent erosion of stockpiles, and to maintain salvaged soil quality and quantity, are presented in [Volume 1, Section 7.6.2.3](#). In addition, as required by *Alberta Environmental Protection and Enhancement Act* Approvals, stockpile locations, volumes stored, volumes used in reclamation, and subsequent volumes will be tracked to ensure adequate volumes remain for final reclamation; these volumes will be submitted in an Annual Conservation and Reclamation report to Alberta Environment. Salvaged soil stockpiles will be situated away from plant operation activities, and will not be used for any purpose other than reclamation during site operation or at closure.
- f. The measures presented in the Conservation and Reclamation plan will be implemented, so excessive soil loss during operation of the facility is not anticipated. In the unlikely event of excessive soil loss during site operation, as is common in reclamation in agricultural areas, manure may be used to supplement replaced topsoil, and topsoil from third party sources may be available (e.g., residential subdivisions).
- g. Use of some of the salvaged soil in landscaping berms is intended to expose a greater amount of salvaged soil to plant growth over the life of the facility, and thus

promote associated biological activity. Not developing the environmentally more sensitive quarter section SE2 56-21-W4M limits the area available for soil storage and requires that long-term stockpiles will have to be included for storage.

StatoilHydro

Approved: SC	Revision Date: 07/15/08
File: 6198-SP-08.DWG	
Drawn by: BSW	Checked: BE

54	Volume 1, Section 7.4.2, Page 100 Statoil states <i>The topography of the LSA is fairly uniform with undulating surface expression. Slopes are 2% to 10% with the exception of the dunes located in the northernmost quarter section (SE 2-56-21 W4M) of the LSA. Slopes of the dunes ranged from 5% to 15%.</i>
	a. Clarify if these dunes have any significance and/or protection in Alberta and if so provide possible mitigation measures.

Response

- a. The dunes are not protected in Alberta. The northernmost quarter section (SE 2-56-21-W4M), including the dunes, will not be disturbed as part of Upgrader development. Therefore no additional mitigative measures are considered to be necessary.

55	<p>Volume 1, Section 7.6.1.4, Page 103 Statoil states <i>Non-chemical control of weeds (mowing, cultivation, hand picking) will be used where practical; chemical weed control will be used when necessary.</i></p> <p>a. What criteria will Statoil apply when determining which method of weed control to apply (chemical versus non-chemical)?</p> <p>b. Provide Statoil's weed management plan.</p>
----	--

Response

- a. The method of weed control will depend on the site-specific infestation, and will depend on the location of the weeds, size of the weed patch, distribution of the weed patch (e.g., small concentrated patch vs. sporadic over larger area), type of weeds, growth stage of the weeds and desired target vegetation, and weed presence relative to the surrounding agricultural areas.

As is common in agricultural management, chemical control may be selectively used during establishment of the reclamation target vegetation in order to allow the target species to establish and achieve a healthy, actively growing vegetation cover. Establishment of the target species will be key to discouraging weeds from establishing. Subsequently, non-chemical control of weeds will be used where practicable (e.g., hand picking of weeds in small patches before they spread). Some weeds that occur sporadically over a larger area may be controlled with regular mowing during a season and by not allowing them to set seed and disperse, particularly annual weeds that occur in the area ([Volume 4, Section 10, Table 10.5-2](#)). Cultivation and re-seeding may be used, though it is less preferred as this has the disadvantage of having to re-establish the target vegetation without weed establishment. The standard agricultural management practice of herbicide application will be used, where needed, to achieve control of weeds.

- b. Weed management measures were presented in the Application, in [Volume 1, Section 7.6.14](#) (Weed Control), [Section 7.6.4.6](#) (Re-vegetation and Weed Control), and [Section 7.6.4.8](#) (Monitoring and Reporting). StatoilHydro will develop a more detailed Vegetation Management Plan for the site before the start of construction.

56	<p>Volume 1, Sections 7.6.1.3 and 7.6.2.3, Pages 103 and 108</p> <p>Statoil states <i>exposed soil areas (including salvaged soil stockpiles) will be re-vegetated or otherwise protected with site appropriate measures, such as straw matting, crimping or coconut mats and Salvaged topsoil will be seeded with a non-invasive, low maintenance grass/legume seed mixture to encourage biological activity in the rooting zone and prevent seed erosion.</i></p>
	a. What specific seed mix or agronomic species will be used?
	b. Provide rationale to support the use of this seed mix or agronomic species.

Response

- a. The seed mix will be determined in consultation with Alberta Agriculture and other stakeholders. An example of an agronomic seed mix suitable for reclamation purposes is given in [Table 56-1](#) below:

Table 56-1 Agronomic Seed Mix Suitable for Reclamation

Common Name	Scientific Name	% of Seed Mix
Creeping Red Fescue (cv. Boreal)	<i>Festuca rubra</i>	20
Fowl Bluegrass (cv. Common)	<i>Poa palustris</i>	20
Slender Wheatgrass (cv. Adanac)	<i>Agropyron trachycaulum</i>	15
Tufted Hairgrass (cv. Nutraceat)	<i>Deschampsia cespitosa</i>	20
Western wheatgrass (cv. Walsh)	<i>Agropyron smithii</i>	20
White Clover (cv. Noducoat)	<i>Trifolium repens</i>	5

- b. The revegetation plan is designed to balance revegetation goals such as erosion control and soil conservation with the desire to facilitate ingress of native species from adjacent undisturbed areas. Plant species have been selected based on their compatibility with pre-disturbance plant communities as well as their ecosystem function (i.e., compatibility in above ground and below ground resource allocations, growth habit, nutrient use efficiency, soil stabilization potential, nitrogen-fixation ability, and habitat and forage values) (Smreciu et al., 2002).

Reference

57	<p>Volume 1, Section 7.6.4.4, Page 111 Statoil states <i>The salvaged subsoil will then be replaced evenly...Finally the salvaged topsoil will be evenly replaced...</i></p> <p>a. Comment on the rationale Statoil used to determine the topsoil and subsoil replacement depths. Include a discussion on how the site specific information obtained during soil inspections would be used.</p>
----	--

Response

- a. The soil replacement strategy is targeted to the final use of cultivated agriculture, which is the current (and anticipated post reclamation) land use for the parts of the lease to be disturbed. The target reclamation surface form will be undulating with very gentle to gentle slopes with the aim of creating similar variability in topography as currently exists. This undulating surface and the use of large equipment in soil replacement will lead to some variability in the thickness of the replaced soils. Also as subsoil thicknesses are currently variable, and not all subsoil is salvaged, subsoil depths will also be variable after soil replacement.

Overly variable topsoil and subsoil depths result in soil qualities that adversely impact agricultural plant growth and make field management more difficult. These qualities include variable seed bed depth, and variable nutrient and moisture distribution. This leads to variable yield, and causes additional difficulties in agricultural management of such fields. Thus significantly uneven replacement of salvaged soil has not been targeted. The post reclamation ecosite function and biodiversity are anticipated to eventually be similar to pre-disturbance conditions and surrounding agricultural land. Management of land for agriculture land use is the main determinant of ecosite (anthropogenic disturbance) function and biodiversity on these, and other agricultural fields.

The soil inspection-site soil data are used primarily to optimize salvage of all suitable topsoil, and sufficient subsoil, while maintaining the soil salvage quality in order to achieve equivalent land capability after reclamation.

58	<p>Volume 1, Sections 7.4.2 and 7.6.4.7, Pages 100 and 112</p> <p>Statoil states <i>All soils found in the LSA were non-saline and non-sodic, with the exception of the small Peace Hills gleyed variant (PHSglxc) unit (6 ha) in NE 35-55-21W4M. Statoil also states The Peace Hills soils under agriculture in NE 35-55-21W4M and any other sandy soils encountered will be mixed with other, finer textured topsoil salvaged in the Project area to improve texture and associated properties for agriculture.</i></p> <p>a. Discuss Statoil's proposed procedures for soil handling and storage of the identified saline/sodic soils in NE 35-55-21W4M.</p> <p>b. Confirm that the saline/sodic soils identified in NE 35-55-21W4M will not be mixed with other soils (e.g., will be stripped and stored separately). How will this be ensured?</p>
----	--

Response

- a. There are eight soil inspection points in or within 200 m of the PHSglxc unit which is a slightly depressional, moister area with gleyed soils. Of these soil inspection points, only one inspection point had significantly elevated salinity (weakly saline in topsoil, moderately saline in subsoil). The map unit boundaries for this unit are thus fairly well controlled. Additional site-specific soil sampling will be carried out prior to construction to further assess this small area. Soil sample results will be used to further characterize and delineate potentially saline soils. An electromagnetic survey (EM38) may also be used to assist in delineation of this area. Saline topsoil in this area will be salvaged separately from the surrounding topsoil and will be stored in a separate pile. Subsoil will also be salvaged separately, and stored in another separate pile. An environmental monitor, knowledgeable in soils, will supervise the soil handling. The exact storage locations for saline soils are not yet known; however, they will be in an area separate from non-saline soils, that will not be impacted by operations, and will not be immediately adjacent to any slough areas. Storage locations will be recorded and included in the Annual Conservation and Reclamation report to be submitted to Alberta Environment. Erosion control measures of these piles will be undertaken as per [Volume 1, Section 7.6.1.3](#). These soils will be returned to their area of origin during reclamation.
- b. See the response to Part a, above.

59	<p>Volume 4, Section 9.7.4, Table 9.7-3, Page 9-37</p> <p>Statoil states that potential acidification is reversible in the long-term.</p> <p>a. Explain over what time frame Statoil expects soil acidification will be reversible.</p> <p>b. Discuss how this reversal will occur and what measures Statoil will take to ensure this impact is reversed.</p>
----	--

Response

- a. Based on published literature results for soil types similar to those found in the study area, StatoilHydro anticipates the time frame for natural recovery of soil pH reaction on calcareous soils, where there are no further acidifying inputs (air deposition or fertilizer), to be between 5 and 20 years; the exact time frame is dependent on soil parent material and calcareous dust deposition (Giesler et al., 1996, Skjelkvale et al., 2003, Houle et al., 2006). Applications of lime provide for rapid reversal of acidification in a one year time frame. Depth of soil acidification is also important in determining the time frame required for a soil to recover from acidification, as surface soil horizons can be treated topically with limestone, while lower depth horizons cannot. Management and/or treatment for soil acidification will be conducted throughout the project life span and following the closure of the project.

Natural variation in soil pH values is known to occur in agricultural soils in western Canada. Monitoring programs for soil acidification due to solid sulphur handling on facilities (Alberta Environment, 1989) recognize a 1 pH unit variance as being within the normal variability of soils. That is, a sustained (more than one year) change of more than one pH unit is required to establish a trend of decreasing soil reaction on agricultural soils in Alberta. A change of this magnitude and duration would trigger a management response

-
- b. The primary component responsible for reversal of soil acidification is the removal of acidifying inputs. The literature indicates that deposition of alkaline dust is one of the primary mechanisms of naturally ameliorating soil acidification in surface horizons. Where warranted by changes in pH of more than 1 pH unit in surface soil, application of lime is the primary method of neutralizing acidic pH values on agricultural land.

Exposure of soil to potentially acidifying inputs is a cumulative effect of regional industry. StatoilHydro is committed to working with other industries in the region to collectively address any trends in soil reaction that are identified through regional soil monitoring.

60	<p>Volume 4, Section 9.7.4, Table 9.7-3, Page 9-37</p> <p>Much of the soil assessment is based on percent changes in soil characteristics between the Base and Application Cases. Magnitude ratings are then assigned to these percent changes as shown in Table 9.7-3.</p> <p>a. What was the rationale for the magnitude ratings in Table 9.7-3?</p> <p>b. Identify the source of the magnitude ratings (i.e., scientifically defensible standard or professional judgment). If they are based on a scientifically defensible standard, outline the standard and cite appropriate references.</p>
----	--

Response

- a. The final impact ratings presented in [Volume 4, Section 9.7.4, Table 9.7-3](#) are low in all cases. The goal of reclamation is to achieve equivalent land capability at site closure as required by the Alberta *Environmental Protection and Enhancement Act* (EPEA). The Alberta Environment Reclamation Criteria (including 2007 Green Area Update) describe the allowable changes (or impacts) in site conditions including land, soil and vegetation. Other regulatory guidelines and requirements (e.g., Approval conditions) also describe the allowable changes in site conditions. The fundamental principal of the criteria is that the success of land reclamation is measured against the original (pre-construction) or representative (adjacent) site conditions with due consideration for construction norms at the time of the development. The conservation and reclamation plan (C&R) is implemented to achieve acceptable changes (impacts) to site conditions (properties) as defined by EPEA and regulatory guidelines; the final reclamation assessments for certification will assess site conditions in comparison to pre-construction or representative site conditions as described in the regulatory reclamation guidelines. Sites meeting the guidelines are thus indicated to have acceptable impacts to site conditions (and land capability). In addition to the guidelines, StatoilHydro will address site impacts to a degree acceptable to the regulatory agencies at all stages of operation and closure.
- b. StatoilHydro's interpretation of current reclamation guidelines and professional judgment were used to assess the magnitude of potential impacts. A magnitude rating of low was assumed in all cases where changes were interpreted to meet regulatory requirements, changes were anticipated to be acceptable to regulatory agencies following reclamation, and where a change at site closure accounted for a 10% or less change in the overall resource in the application scenario as compared to baseline.

61	<p>Volume 4, Section 9.8.3, Page 9-41</p> <p>Statoil states <i>The Cumulative Case results in an additional 4, 684 ha of soil where the critical load may be exceeded by PAI...On the basis of the RSA, the change in soils at risk of having critical load exceeded by PAI is negative in direction, regional in geographic extent and low in magnitude, resulting in a final impact rating of low impact to soils from changes in PAI in the RSA for the Cumulative Case. High sensitivity soils constitute 71% of the soils where PAI may exceed critical load of soils.</i></p> <p>a. Explain how an impact large in aerial extent was considered to be low in magnitude.</p>
----	--

Response

- a. As indicated in [Volume 4, Section 9.4.2](#), soil mapping of the regional study area (RSA) was obtained from AGRASID 3.0 published at a 1:100,000 scale (AGRASID; ASIC, 2001). Some soils mapped in AGRASID appear as single soil series, indicating the identified series is dominant in the mapped segment. Other soils are designated with two soil series names, indicating that two co-dominant soil series occur together over the mapped segment; in this case, both soils were accounted for while preparing the regional study area (RSA) map. When co-dominant soils are mapped together, it cannot be assumed where or in what concentration each of the individual soils occur within that mapped region. When a co-dominant soil map unit had two different critical loads the more conservative critical load was applied to the whole map unit. For example, in the case of map unit PRZO, the co-dominant soils were Primula (PR) with a critical load of 0.25 keq H⁺/ha/y and Miscellaneous Organic (ZO) with a critical load of 0.5 keq H⁺/ha/y. For this map unit, the more conservative critical load of 0.25 keq H⁺/ha/y was applied to the whole map unit. The combination of the co-dominant soil mapping and the application of the more severe of the two soil critical load levels to the whole co-dominant soil map unit, results in an over-estimate of the hectares of soil at risk of having critical load exceeded by potential acid inputs (PAI), perhaps by as much as 40% to 50%. However, with the available regional mapping resources, no other method can be used to represent the soils in the RSA.

The two soil map units where this effect is most relevant are PRZO and the Manatokan–Primula (MNaaPR) units. These two units account for 61% of the hectares where a change in PAI concentration occurs between the Cumulative case and the Baseline case. If the soils were mapped at a greater resolution, allowing for identification of individual soil series, then the proportion of Manatokan and Miscellaneous Organic soils could be assigned their corresponding critical load of 0.5 keq H⁺/ha/y, and some of the hectares identified as having a potential for PAI to exceed critical load would not be included in the calculation for change from baseline.

Given that the methodology results in an overstatement of the areal extent of soil at risk of having PAI exceed critical load, the magnitude of the change in hectares at risk of having PAI exceed critical load was considered low.

62	<p>Volume 4, Section 9.9.2, Page 9-43 Statoil states <i>North American will participate in regional soil monitoring programs existing in the RSA.</i></p> <p>a. Discuss if any of these soil monitoring programs evaluate acid deposition impacts on soil and vegetation.</p> <p>b. Discuss Statoil's commitment to initiating its own soils and vegetation monitoring program.</p>
----	--

Response

- a. StatoilHydro commits to participating in regional monitoring efforts through their membership in the Northeast Capital Industrial Association and Fort Air Partnership. The Fort Air Partnership operates air monitoring stations and samples for numerous parameters including those that may result in acidification impacts to soil and vegetation. As yet, there are no direct regional monitoring programs established.
- b. StatoilHydro would be pleased to work with other industry members of the region on any soil and vegetation monitoring programs developed under a regional framework.

63	Volume 4, Sections 9.5 and 10.6.2.3, Figures 9.5-7 and 9.7-1, Table 9.5-10, Pages 9-20, 9-30, 9-38, 10-30 and 10-31 Statoil states <i>No highly sensitive soils were found in the RSA</i> . However, Table 9.5-10 identifies Primula as a highly sensitive soil series in the Local Study Area (LSA) and Figures 9.5-7 and 9.7-1 identify two areas of soil classified as having a high sensitivity to acidification.
	a. Clarify the apparent discrepancy and update any tables and/or figures as appropriate.

Response

- a. The statement in [Volume 4, Section 10.6.2.3](#) is incorrect. [Volume 4, Section 9.5](#) and [Figures 9.5-7](#) and [9.7-1](#) are correct in identifying areas of soils with high sensitivity to acidification (critical load of 0.25 keq H⁺/ha/y).

64	Volume 4, Section 10.4.6, Page 10-11
	a. How did Statoil identify potentially occurring rare plant communities within the project area or Natural Region prior to field work?
	b. Elaborate on the method used for conducting the rare plant community survey, including pre-field work preparation and data collection (as it relates to assessing dominant species and physical site characteristics of an ecological community).

Response

- a. Rare plant communities that could potentially occur in the LSA were identified prior to field work using Wheatley and Bentz (2002) and the Alberta Natural Heritage Information Centre's (ANHIC) Ecological Community Tracking & Watch List (Allen, 2008). Both these documents differentiate assemblages based on their dominant species and note those that are considered rare. Other documents consulted include Environmentally Significant Areas of Alberta (Sweetgrass Consultants, 1997), and recent environmental studies carried out in the region.

- b. Field surveys were conducted as random meanders. These were done on August 22, 2006, and June 29 and 30, 2007. Different sites were surveyed on each trip (i.e., sites surveyed in 2006 were not revisited in 2007). In 2007, priority was given to areas that are within the proposed footprint, although some areas that are within the property but not under the footprint were also surveyed. The protocol for random meanders as described in [Volume 4, Section 10.4.4](#) is as follows:

Meanders involve walking randomly through a site and noting each new species until no more new species are observed (Lancaster, 2000). They are recommended by the Alberta Native Plant Council as an effective scientific means of assessing an area for rare plants (Lancaster 2000), and can also be used to compile a representative list of species in a given habitat. For this assessment, common tree, shrub and groundcover species (forbs and cryptogams) were recorded at all survey sites. A list of all species encountered in the LSA is provided in [Appendix 10A](#). Species lists and GPS co-ordinates were recorded for each meander, and photographs were taken of representative vegetation at each location. The location of sampling sites is shown in [Figure 10.4-1](#).

65	<p>Volume 4, Sections 10.6.2.3, 10.7.2, 10.8, and Table 10.9-1, Pages 10-30, 10-31, 10-41 and 10-49</p> <p>In Section 10.7.2 Statoil indicates that vegetation within the LSA and Regional Study Area (RSA) will be exposed to SO₂ and NO₂ concentrations that exceed critical concentration thresholds, and nitrogen deposition levels above critical nitrogen deposition rates. Moreover, Statoil indicates in Section 10.6.2.3 and 10.8 that the area affected by NO₂ and SO₂ will increase by 2,527 ha and 91 ha respectively.</p>
	a. Describe the local and regional monitoring programs Statoil will participate in to evaluate NO ₂ and SO ₂ effects on vegetation.
	b. Discuss Statoil's commitment to initiating, or participating in any of the existing vegetation monitoring programs for the region.
	c. Discuss why air emission effects were not considered in Table 10.9-1 and provide an updated table as appropriate.

Response

- a. StatoilHydro will participate in the Fort Air Partnership in the monitoring of regional air quality. StatoilHydro is committed to open access to air quality data and will also support any future regional vegetation monitoring initiatives. Involvement in such an initiative would be through StatoilHydro's membership in the Northeast Capital Industrial Association (NCIA) and the Fort Air Partnership.
- b. Through the NCIA, StatoilHydro will support the Beaver Hills Initiative (BHI), a partnership between local, provincial and federal government divisions, academia, industry and non-governmental organizations. The BHI supports co-operative efforts to sustain quality of water, land, air, natural resources and community development in the Cooking Lake Moraine (BHI, 2007). Part of the Cooking Lake Moraine falls within the RSA of the Upgrader. The Research and Monitoring Group of the BHI oversees several ongoing vegetation monitoring programs in association with its partners, including an Air Quality Monitoring study in partnership with Fort Air Partnership, BA Energy and the University of Alberta (BHI, 2008).

StatoilHydro is also committed to supporting any future local or regional vegetation monitoring initiatives, including the Alberta Biodiversity Monitoring Institute (ABMI). The ABMI sample protocols monitor a wide suite of environmental indicators across Alberta including vascular plants, mosses, fungi and lichens, wildlife and aquatic species and other biotic and abiotic indices of habitat structure and condition (ABMI, 2008).

- c. The exclusion of air emissions from [Volume 4, Section 10.9, Table 10.9-1](#) was an omission. [Table 65-1](#) is provided below.

Table 65-1 (Revised Table 10.9-1) Summary of Potential Impacts on Vegetation and Wetlands in the LSA

	Parameter	Direction	Extent	Magnitude	Duration	Frequency of Occurrence	Permanence	Level of Confidence	Final Impact Rating
LSA									
Terrestrial Vegetation	Removal of Vegetation	Negative	Subregional	Low	Medium-term	Isolated	Reversible in long term	High	Low
Wetlands	Removal of Vegetation	Negative	Subregional	Medium	Medium-term	Isolated	Reversible in medium term	Medium	Medium
	Alterations in Hydrology	N/A	N/A	N/A	N/A	N/A	N/A	N/A	No impact
Rare Plants	Removal of Vegetation	N/A	N/A	N/A	N/A	N/A	N/A	N/A	No impact
Rare Plant Communities	Removal of Vegetation	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
RSA									
Terrestrial Vegetation	Removal of Vegetation	Negative	Subregional	Negligible	Medium-term	Isolated	Reversible in long term	High	Negligible
	Air Emissions	Negative	Subregional	Negligible	Medium-term	Continuous	Reversible in medium term	Medium	Negligible
Wetlands	Removal of Vegetation	Negative	Subregional	Negligible	Medium-term	Isolated	Reversible in long term	High	Negligible
	Air Emissions	Negative	Subregional	Negligible	Medium-term	Continuous	Reversible in medium term	Medium	Negligible

The impact assessment for air emissions is focussed on impacts during project operation because emissions will cease following closure

N/A - not applicable.

66	<p>Volume 4, Section 10.4.6, Page 10-11, Appendix 10B, Table 10B-1, Page 10B-1</p> <p>Provide rationale for only including the potentially rare vascular plant, bryophyte and lichen species listed in Table 10B-1 and not the complete list of potential rare vascular plant, bryophyte and lichen species that occur in Central Parkland and that are listed in Alberta Natural Heritage Information Center's tracking and watch lists.</p>
----	--

Response

[Volume 4, Appendix 10B, Table 10B-1](#) provides a list of the rare plant species in the Dry Mixedwood and Central Parkland that were considered most likely to occur in the LSA, based on data given in Kershaw et al. (2001) and provided by ANHIC. This table was compiled to provide background information only. It was considered unnecessary to provide the complete list of all possible rare plant species that could occur in the Dry Mixedwood or Central Parkland. The protocol used to complete the rare plant surveys required that observers record occurrences of any species that is considered rare in the province of Alberta, regardless of whether or not it is listed in [Table 10B-1](#).

67	<p>Volume 4, Section 11.4.4, Page 11-11</p> <p>Statoil states <i>Based on the metrics derived from survey data, and knowledge of species habitat requirements, the vegetation land units within the LSA and RSA were rated for habitat quality...All ratings were based on the assumptions that individuals of each species or species group would be found within each habitat type (as rated above) in similar abundances.</i></p> <p>a. Describe how the habitat ratings for each species, or species group were derived. Indicate what factors were considered and how model assumptions were validated (consultation with specific experts, RSF functions, etc).</p>
----	--

Response

- a. The ratings of each habitat patch were considered to be relative to each other. The highly fragmented habitat of central Alberta would all receive relatively low ratings compared to more contiguous forest or native prairie found elsewhere in the province. Given the relatively low quality and quantity of suitable wildlife habitat in the study area, a relatively simplistic rating scheme was developed.

The habitat rating system used in the StatoilHydro assessment was based on professional experience within the region and was derived from:

- field data collected for the project,
- existing published or unpublished information sources, and
- the classification of habitat types in related projects in the region.

Specific information on habitat ratings is presented below.

Considerable information on bird habitat requirements has been accumulated and made available through the Birds of North America project (Poole and Gill, eds., 2008). The series contains individual species accounts for all of the bird species found in the region. Another source used to rate bird habitat was Poston et al. (1990).

In addition to the above publications, nearly 20 years of research and survey experience with birds of the region played an important role in developing the habitat rating scheme for birds by the lead biologist.

Other extensively experienced biologists were available for consultation at Westworth Associates. These biologists were a source of knowledge for deriving rating schemes for wildlife such as ungulates. The experience of the associated biologists is represented by publications that are listed in the literature cited in [Volume 4, Section 11](#) (Westworth and Knapik, 1987; Westworth et al., 1989).

Also, biologists in the province have published provincially specific habitat requirements for the mammal and amphibian species that could potentially be found on-site. The following examples are listed in the literature cited section

of [Volume 4, Section 11](#) (Pattie and Hoffman, 1990; Russell and Bauer, 1993; Smith, 1993).

Waterbirds, amphibians and some songbirds are dependent on wetlands. The quality of the wetland habitat was dependent upon the type of wetland. A standardized classification system was used to classify the wetlands found on the Property. The classification system used can be found in Stewart and Kantrud (1971).

Finally, information and or data collected for nearby environmental assessments were available either directly through Westworth Associates or indirectly through Jacques Whitford AXYS Ltd. This information is described in, BA Energy (2004), North West Upgrading Inc. (2006) and Shell Canada Limited (2005).

Based on the above sources, the habitat rating schemes presented in [Table 67-1](#) were developed.

Due to the limited amount and quality of the habitat found in the study area, cross-validation of the model classifications was considered unnecessary to obtain acceptably accurate predictions of baseline and operation habitat availability in the study area.

68	<p>Volume 4, Sections 11.5.1.3 and 11.5.1.4, and Figure 11.5-1, Pages 11-27 and 11-45</p> <p>Statoil describes multiple possible wildlife movement corridors linking to the North Saskatchewan River, including one that intersects the LSA.</p> <p>a. Describe the regional initiatives Statoil is involved in or will become involved in to maintain wildlife movement in the region.</p>
----	--

Response

- a. StatoilHydro will participate in regional wildlife movement programs as they develop. In addition to the conservation of the native habitat in the northern portion of the StatoilHydro property (SE2 56-21-W4M), StatoilHydro is considering the creation of a nominally 25 m greenbelt around much of the perimeter of the property. The proposed greenbelt would contribute to maintenance of wildlife movement corridors in the region. Where possible, only the StatoilHydro facility footprint will be surrounded by security fencing, leaving the area between the fence line and the property line for unrestricted wildlife use. The ultimate plan for the green space will require considerable planning to find a balance between the maximum degree of habitat suitability and the least interference with the operation of the Upgrader.

Due to the low proportion of moderately to highly rated wildlife habitat on the StatoilHydro property at baseline, the maintenance and or creation of additional wildlife habitat around the property will likely mean a net increase in the availability of suitable wildlife habitat on the property.

69	<p>Volume 4, Section 11.6.2.1, Pages 11-66 and 11-67</p> <p>Statoil states that “...the size and placement of the wetland mitigation will be determined at a later date.”</p> <p>Provide an update on Statoil’s wetland mitigation plans, including:</p> <ul style="list-style-type: none">• A schedule for developing the wetland mitigation plan;• Components of the wetland mitigation plan that are regionally/watershed specific to this project and will be used to determine appropriate compensation;• A schedule for implementation of the wetland mitigation plan (relative to pre-construction efforts and throughout the life of the project);• Compensation options under consideration for this project;• Types of enhancement efforts to the wetland in SE 2-56-21W4M and how these efforts are anticipated to factor in to compensation considerations;• Use of existing wetland soils in wetland compensation options (in particular the Mixed Shrubland wetland that has unique species);• Indicators of surface water management (with respect to flood control, drainage and erosion measures) that will be monitored during construction and operations to assess mitigation effectiveness (as a result of the loss of wetlands) on regional wetlands, Astotin Creek and unnamed tributaries;• Wetland monitoring programs, including monitoring of water levels, habitat and health of regional, undisturbed wetlands, Astotin Creek, unnamed tributaries and reconstructed/restored/enhanced wetlands.
----	---

Response

The details of any wetland mitigation plan will be developed in co-ordination with, and approval from, Alberta Environment, as described in [SIR Response 52](#). Details of the schedule, components, monitoring, etc., will be described in that plan.

The Wetland Management Plan will be finalized for approval prior to the start of topsoil stripping.

70	Volume 4, Section 11.6.2.1, Pages 11-66 and 11-67 Clarify if Statoil has explored opportunities to enhance wildlife habitat on the development site (e.g., establishment of native vegetation shelterbelts around the industrial site, establishment of nest boxes or nest platforms (for both raptors and songbirds), establishment of nesting islands, creation of snags, provision of downed woody material, etc). If so, what wildlife species would be targeted and what type of habitats currently existing in the LSA, the RSA, the Dry Mixedwood Forest or Central Parkland would be recreated or mimicked to enhance native wildlife or biodiversity values on the developed site?
----	---

Response

Areas outside of the Upgrader fence-line will be left in a natural state or enhanced in cases where the current land use is cultivated agriculture (a land cover that is not suitable for most wildlife).

As reported in the Application, the SE 2-56-21-W4M will not be developed; this quarter section contains native habitat suitable for waterfowl, raptor, songbird, amphibian, and mammal species, including many sensitive species. It is unlikely that the complexity of pre-settlement native habitat can be recreated in the greenbelt to the degree found in the northern portion of the StatoilHydro property. However, through the conservation of the North Wetland Complex and the potential plantings of native tree and shrub species, habitat suitable for nesting, travel, cover, and foraging can be provided for many wildlife species. Due to the low suitability of most of the habitat on the property at baseline, any enhancement of greenbelt from agriculture to native grass, shrub or trees will increase the overall local availability of wildlife habitat and contribute to regional habitat availability.

71	Volume 4, Section 11.8, Page 11-72 The Terms of Reference, item 4.9.4e, states <i>identify and discuss wildlife studies in the area and how NAOS plans to integrate its operational and mitigation activities with those studies</i> . The concordance in Volume 1 (Appendix B1) indicates this information is in Volume 4 Section 11.8, however this section contains no information on either existing studies or how these might be integrated with Statoil's operation.
	a. Provide this information.

Response

- a. There are no ongoing wildlife research studies within the regional study area. However, StatoilHydro is committed to supporting regional databases that would benefit from the data collected during the environmental assessment. In addition to supporting the Alberta Biodiversity Monitoring Institute ([SIR Response 65](#) and [SIR Response 72](#)), the StatoilHydro wildlife data can be added to the provincial Fish and Wildlife Management Information System (FWMIS). This continuously growing database of biological observations is an important tool used by government and industry to make informed decisions about land use and wildlife management. The FWMIS database would benefit from data submissions from region in which the StatoilHydro project is proposed.

72	<p>Volume 4, Sections 11.7, 11.8 and 12.8, Pages 11-38, 11-72 and 12-35</p> <p>Statoil states that construction of the project is not predicted to affect wildlife at the local or regional cumulative scales; therefore no wildlife monitoring is warranted. However, cumulative effects of vegetation/wetland removal and loss of wildlife corridors are predicted (Section 11.7). In Section 12.8 Statoil states that it will undertake vegetation and wildlife monitoring in support of the Canadian Biodiversity Strategy.</p> <p>a. Clarify the apparent discrepancy and provide details of any wildlife monitoring Statoil is planning to implement. Include a discussion on the species, or species groups that may be targeted and the rationale for targeting these species.</p> <p>b. Describe any regional monitoring programs Statoil will participate in to evaluate effects on wildlife.</p>
----	--

Response

- a. Based on the results of the environmental impact assessment, no wildlife monitoring is warranted. However, StatoilHydro recognizes the need for monitoring information in support of the Canadian Biodiversity Strategy. On this premise, StatoilHydro will provide environmental data accordingly.

The management of biodiversity requires coordinated policy, planning, and decision support capabilities. StatoilHydro will support the monitoring program of the Alberta Biodiversity Monitoring Institute (ABMI). The ABMI sample protocols monitor a wide suite of environmental indicators across Alberta including vascular plants, mosses, fungi, lichens, phytoplankton, birds, mammals, fish, springtails, mites, zooplankton, benthic invertebrates, live and dead trees, down logs, soil, shrub cover, vegetative litter, water physiochemistry, water basin characteristics, and landscape characteristics. The ABMI monitors the status and trends of more than 2000 species, 200 habitat elements, and 40 human footprint variables. The goals of the ABMI database are to directly support the needs of environmental planners, managers and consultants across the province and Canada, and to monitor changes in biodiversity in relation to ongoing development and or changes in land use practices.

In addition to the support of the ABMI, StatoilHydro recognizes the need for a regional stakeholder management and planning organization that focusses on wildlife issues in the Alberta Industrial Heartland region. Currently, frameworks for the management of wildlife habitat and biodiversity appear to be underdeveloped or do not exist. StatoilHydro would support a cumulative effects management framework that would include wildlife and biodiversity issues.

- b. See the response to Part a, above.

73	Volume 4, Section 12.4.1, Page 12-5 Explain how Statoil used the status rankings presented in <i>The General Status of Alberta Wild Species</i> or the endangered and threatened wildlife species listed in the <i>Alberta Wildlife Act</i> in the assessment.
----	--

Response

As discussed in [Volume 4, Section 11.3.1](#), some provincially or federally listed species had the potential to be used as key indicator species to assess the potential Project effects. Along with species that were pre-selected as indicator species based on their socio-economic or biological significance, any additional species found within the LSA identified by the province as *May be at Risk* or *At Risk* or federally listed as *Endangered* or *Threatened*, were to be included as an indicator species (if they were not already chosen). For the StatoilHydro site, only the long-tailed weasel qualified under these criteria and was used as a key species to assess the project effects.

74	Volume 4, Sections 12.5.3.4 and 12.5.3.6, Page 12-16
	a. This section discusses non-native plant species. Provide a similar discussion for non-native wildlife species (i.e., starling, rock pigeon, house sparrow, grey partridge, ring-necked pheasant, and house mouse).
	b. How would Shannon-Wiener Indexes differ between habitat types if non-native wildlife species are not included in the calculation of index values?
	c. How could non-native wildlife species impact biodiversity values on the developed or reclaimed landscape?

Response

- a. In theory, non-native species have the ability to shift biodiversity metrics to favourable numbers because species like starlings, pigeons and house sparrows can exist in large flocks. Large number of flocking birds can introduce a bias to indices such as the Shannon-Wiener that take into consideration the number of individuals of the species found in a habitat type. Therefore, habitat types such as agriculture and habitation-sites could have had inflated diversity index values. However, given the high proportion of agriculture land use in the local study area at baseline, the number of non-native birds detected during baseline surveys was unexpectedly low. Only one European starling and one house sparrow were detected during the surveys. The starling was recorded in an agriculture area and the house sparrow was recorded in a farm yard. Given these observations, the Shannon-Wiener index values change very little change with the removal of non-native species. The index value for agriculture changes from 0.55 to 0.53. The index value for habitation changes from 0.54 to 0.53. Therefore, the relative position of these habitat types in a rank of habitat type rankings does not change (Table 74-1 below).

Table 74-1 Bird Species Diversity (BSD) by Habitat Type in the Study Area

Habitat	Index with non-native species	Index with non-native species
Mixedwood Forest of Natural Areas	1.08	1.08
Populus spp. woodlot	0.98	0.98
Salix spp. shrubland	0.55	0.55
Agricultural Land	0.55	0.53
Habitation	0.54	0.53
Class IV Wetland	0.41	0.41
Spruce-dominated Woodlot	0.28	0.28
Early Successional Mixed Shrubland	0.19	0.19

- b. See the response to Part a, above.
- c. See the response to Part a, above.

75	Volume 4, Section 12.5.3.6, Page 12-16 How will Statoil use the biodiversity information presented to develop and evaluate the success of the reclamation plan?
----	---

Response

Biodiversity data included in the assessment (e.g., degree of habitat fragmentation, species richness, presence of rare and weed species) provide a baseline against which the progress and final success of reclamation will be assessed. These data can be used in conjunction with the findings of conservation/reclamation monitoring programs (as described in [Volume 1, Section 7.6.4.8](#)).

Furthermore, data in the report that show the local distribution of non-native and invasive species provide a baseline against which StatoilHydro will compare the effectiveness of its weed management and control program. An increase in the distribution of weed species or the appearance of previously unidentified weed species that would potentially have a negative impact on biodiversity would result in control measures consistent with the Alberta *Weed Control Act*, federal and provincial government commitments to conserving native species (Environment Canada, 1995; AEP, 1998) and StatoilHydro's vegetation management program.

76	<p>Volume 4, Section 12.6.2, Page 12-25</p> <p>Statoil states <i>Mitigation measures will be designed to compensate for the dewatering of wetlands in the LSA. Details of this scheme were not finalized at the time of this assessment, but it is expected that reconstructed wetlands will provide habitat conducive to the recolonization of the species found in wetlands that will be dewatered in the LSA.</i></p> <p>a. Discuss the role of reconstructed wetlands in the wetland mitigation plan, given that Alberta Environment's <i>Provincial Wetland Restoration/Compensation Guide</i> (2007) states that <i>Wetland compensation in Alberta is a process that requires the restoration of drained or altered naturally occurring wetlands. The compensation process does not allow for the development of artificial wetlands.</i></p>
----	---

Response

- a. See [SIR Response 52](#). It is StatoilHydro's understanding that Alberta Environment's *Provincial Wetland Restoration/Compensation Guide* (2007) is a draft guide. A newer policy, the draft *Alberta Wetland Policy* was issued in June 2008 but it has not yet been approved by the Government of Alberta. StatoilHydro will work with Alberta Environment to develop an appropriate mitigation plan recognizing that reconstructed wetlands may not be accepted as appropriate compensation.

77	Volume 4, Section 12.5.2, Figure 12.6-1, Table 12.5-1, Pages 12-11 to 12-29 Statoil states <i>Sixteen different cover categories were identified in the RSA, based on AGCC data. Of these, 13 are terrestrial vegetation communities, six are wetlands and five are anthropogenic disturbance categories (Table 12.5-1).</i> This statement seems to imply there were 24 different cover types classified, not 16. Table 12.5-1 shows 7 terrestrial, 5 wetland, and 5 anthropogenic units plus cloud/haze (18 landscape units in total). The legend in Figure 12.6-1 identifies 17 landscape units -- 7 terrestrial, 5 wetland, 4 anthropogenic, and cloud/haze.
	a. Explain these apparent discrepancies and update any tables and/or figures as appropriate.

Response

- a. The statement given in [Volume 4, Section 12.5.2](#) was made in error. It should have read as follows:

Eighteen different cover categories were identified in the RSA, based on AGCC data. Of these, seven are terrestrial vegetation communities, five are wetlands and five are anthropogenic disturbance categories. The remaining category represents areas where cloud and haze obscured the ground surface ([Table 12.5-1](#)).

Seventeen of these categories are given in the AGCC Code Descriptions key on figures showing the RSA. The eighteenth category, Baseline Disturbances, is not an AGCC category and is therefore given under Legend on these figures.

78	<p>Volume 4, Section 12.9, Page 12-35</p> <p>Statoil states <i>It is assumed that the loss of this habitat (Habitation) will be compensated for by new construction in and around the LSA during the construction and operations phases and after Project closure.</i></p> <p>a. Provide evidence to support this assumption.</p> <p>b. What mitigation has Statoil considered implementing to compensate for the loss of habitation should this assumption prove to be incorrect?</p>
----	---

Response

- a. This assumption is supported by the findings of the Socio-economic Impact Assessment (SEIA) ([Volume 5, Section 15](#)). The SEIA provides predictions of local and regional population growth based on the expectation that new operations workers will be attracted to nearby communities. It is assumed that such growth will require new residential development.
- b. A relatively high number of breeding birds were recorded at survey sites located at Habitations, possibly because these sites provide nesting opportunities. StatoilHydro will provide alternative nest sites (e.g., nest boxes) during project operation and at closure. Some mammals (particularly ungulates) may also benefit from the cover provided by trees around habitated areas.

In the longer term, StatoilHydro will compensate for the loss of this cover by planting trees around the property as part of landscaping and by providing a buffer around the Upgrader (as described in [SIR Response 68](#)).

WATER

79	<p>Volume 1, Sections 4.3.1.1 and 6.4.1, Pages 53 and 92 Statoil states <i>North American is also evaluating alternative water supplies that could reduce its requirements from the North Saskatchewan River, and is participating in a Northeast Capital Industrial Associated (NCIA) committee regarding regional water issues.</i></p> <p>a. How do these regional water issues relate to Alberta Environment's <i>Water Management Framework for the Industrial Heartland and Capital Region</i>?</p> <p>b. Discuss Statoil's participation in the implementation of this framework.</p> <p>c. Provide an update on the evaluation of alternate raw water supply sources and comment on the progress of Statoil's discussion through NCIA in the investigation of the use of a regional water supply.</p>
----	--

Response

- a. These regional water issues are being directly addressed by the Water Management Framework for the Industrial Heartland and Capital Region.
- b. StatoilHydro is actively involved in this initiative with representatives on the Steering and Implementation committees.
- c. StatoilHydro is in discussions with owners of existing licenced water intakes regarding alternative raw water supply sources to meet the objectives of the Water Management Framework. Alberta Environment, through the Framework initiative, is evaluating regional water supply options with participation from Northeast Capital Industrial Associated (NCIA) members including StatoilHydro. Studies are currently being initiated by the Steering and Implementation committees.

80	Volume 1, Sections 4.1.2 and 4.3, Pages 43, 52 and 54 Statoil states <i>Raw water will be withdrawn from the North Saskatchewan River, with a new intake and pipeline connected to the Upgrader.</i>
	a. How does Statoil's proposed water management strategy comply with Alberta Environment's <i>Water Management Framework for the Industrial Heartland and Capital Region</i> , in particular the policy direction that no new physical intakes on the North Saskatchewan River will be approved and that further degradation of water quality is to be avoided?
	b. Discuss the possibility of Statoil jointly developing an intake facility with other proposed projects in the area or sharing an existing intake facility located within or adjacent to the Local Study Area. Describe any discussions held with other operators with respect to developing a common water intake.
	c. Discuss if Statoil has or will explore using saline or non-potable groundwater sources as a water source for the project.
	d. Provide an update on any discussions held with the Department of Fisheries and Oceans with respect to the modeling, design and monitoring of the proposed intake.

Response

- a. StatoilHydro's water management strategy included a proposed dedicated water intake structure and pump station. StatoilHydro's proposed water management strategy was developed prior to the release of the Water Management Framework for the Industrial Heartland and Capital Region (the Framework). Since the announcement of the Framework, StatoilHydro has been investigating alternative water source options in alignment with the intent of the Framework as discussed in [SIR Response 79c](#). StatoilHydro's ultimate water management strategy is no contaminant loading to the North Saskatchewan River, in alignment with the Framework.
- b. StatoilHydro is investigating a variety of water supply options that would address the requirements of the Framework. Discussions with other operators and proponents are confidential at this time.
- c. StatoilHydro has undertaken initial screening on the quality of the regional deep groundwater. Based on the results of this screening, use of regional deep groundwater was determined to be uneconomic for process use due to very high total dissolved solids (TDS). StatoilHydro does not intend to use saline or non-potable groundwater as a water source for the Project.
- d. StatoilHydro has had initial discussions with Fisheries and Oceans Canada to discuss and receive feedback on the preliminary design of the proposed intake.

81	<p>Volume 1, Section 5.3, Page 81</p> <p>Provide an integrated water balance and process flow diagram for each phase of the project which clearly shows all water inputs, production and outputs between major process units, the water treatment system, and effluent ponds. Balances are to be expressed in tonnes per day. As an example of the preferred format and level of detail see Figure 2.1-3, Appendix A, Supplemental Information, November 2006, North West Upgrading Inc. Ensure that all data presented are consistent throughout the application. Ensure the data reconciles all of the noted inconsistencies and questions.</p>
----	--

Response

For Phase 1 and the Project Case updated integrated water balances and process flow diagrams to support the StatoilHydro application are attached in [Figures 81-1](#) and [81-2](#). The water balances are provided in the standard format used in our engineering, with the units provided in m³/h, which is equivalent to tonnes/h.

The following from Volume 1 of the Application are affected by these updated water balances and are provided below:

- [Table 3.5-4](#)
- [Table 3.5-9](#)
- [Table 4.1-1](#)
- [Table 4.2-1](#)
- [Table 4.2-5](#)
- [Tables 4.3-1, 4.3-2](#)
- [Table 5.3-1](#)
- [Figures 5.3-1, 5.3-2](#)

Title:		StatoilHydro	
FIGURE 81-4			
AVERAGE ANNUAL DAY WATER BALANCE FOR THE PROJECT		Approved: DM	Revision Date: Aug 19/08
File: Figure 81-4 Average Annual Day Water Balance Project.doc			
Drawn by: BF	Checked: BE		

82	Volume 1, Section 5.3. Figures 5.3-1 and 5.3-2, Pages 82 to 83
	For each figure clarify:
	a. the purpose of water associated with the delayed coker
	b. the miscellaneous volumes of water
	c. the purpose of water associated with coke ("project coke" has zero water flow)
d. the destination of Zero Liquid Discharge (ZLD) evaporator brine	

Response

- a. The water losses associated with the delayed coker are evaporative losses at the coke maze.
- b. The miscellaneous volumes of water are associated with Biox biosolids, raw water pond dredging, gasification slag, and zero liquid discharge (ZLD) brine and evaporative losses.
- c. The water associated with petcoke represents the water contained as moisture in excess petcoke not consumed for on-site gasification, which is exported off-site. The updated water balance for the Project indicates 1.6 m³/h of water associated with excess petcoke (see [SIR Response 83](#)).
- d. StatoilHydro plans to dispose of ZLD evaporator brine by deepwell injection or deliver it to a third party facility.

83	<p>Volume 1, Sections 5.2 and 5.3, Table 5.2-1, 5.3-1, Figures 5.2-1, 5.2-2, 5.3-1 and 5.3-2, Pages 74, 79, 80, 81, 82 and 83</p> <p>The water consumption volumes for the gasification stages are not consistent between the various tables and figures.</p> <ul style="list-style-type: none">• Table 5.2-1, and Figures 5.2-1 and 5.2-2 indicate 4,104 and 3,216 t/d respectively for gasification 1 and gasification 2• Table 5.3-1 and Figures 5.3-1 and 5.3-2 indicate 5,628 and 2,261 (and 2,489) t/d respectively for gasification 1 and gasification 2. <p>a. Clarify the apparent discrepancy in reported water volumes and provide revised tables/figures as appropriate.</p>
----	--

Response

- a. **Volume 1, Table 5.2-1 and Figures 5.2-1 and 5.2-2** reflect the current design basis. **Table 5.3-1 and Figures 5.3-1 and 5.3-2** have been provided in **SIR Response 81**. The updated table and figures are now consistent with **Table 5.2-1 and Figures 5.2-1 and 5.2-2**. The updated table and figures reflect current engineering, with water balance modifications subsequent to the original Application submission. Overall water consumption for the Project has decreased. The updated annual average daily river withdrawal has decreased by 19% to 32,041 m³/d, which includes a contingency of 15%.

84	Volume 1, Section 7, Page 97 and Volume 3, Section 6.6.2, Page 6-21 With respect to the water intake: a. What criteria did Statoil apply when selecting the proposed water intake site? b. The Conservation and Reclamation Plan does not mention decommissioning of this water intake. What is Statoil's plan for decommissioning this facility? c. Provide evidence to support Statoil's conclusion that ...a reliable scoured depth of 1.8m may be achieved at minimum flow conditions.
----	---

Response

- a. StatoilHydro selected the proposed intake site based on the location of the thalweg relative to the east bank and proximity of available land to the Project site.
- b. The water intake will be the subject of a separate regulatory application. The decommissioning and reclamation of that facility will be addressed as part of that application.
- c. StatoilHydro conducted a preliminary bathymetric survey in the reach of the proposed river intake that indicated a reliable scoured depth can be achieved. StatoilHydro will provide additional information regarding the bathymetry survey and the suitability of the proposed site under separate regulatory application.

85	<p>Volume 1, Sections 4.3.2.1 and 4.3.2.2, Table 4.3-2, Pages 55 to 57 and Volume 3, Sections 7.7.4.3, and 7.7.4.5, Pages 7-43 to 7-44</p> <p>Statoil states <i>For Phase 1, all of the high TDS streams will be discharged to the effluent pond and blended with the treated organic waste stream, unless contamination is detected.</i></p> <p>and <i>The concentration of the high TDS streams will be monitored to ensure that adequate dilution is occurring in the effluent pond to maintain TDS within acceptable levels for river discharge.</i> The effluent pond is then discharged to the North Saskatchewan River via the effluent pipeline.</p> <p>a. What will the proposed test methods and threshold criteria be with respect to detection of organic contamination?</p> <p>b. What will the proposed test methods and threshold criteria be with respect to acceptable Total Dissolved Solids (TDS) levels for river discharge?</p> <p>c. For Phase 1, what are the volumes of treated organic waste stream required to meet dilution requirements?</p> <p>d. Table 4.3-2 indicates that the Project (excluding Gasification 2) no longer has a treated organic waste stream (Biox Effluent) for diluting high TDS effluents (Boiler Blowdown, Ion Exchange Waste/RO Reject, and Cooling Tower Blowdown). How will an acceptable TDS level for river discharge be achieved in this situation?</p>
----	--

Response

- a. StatoilHydro will comply with effluent monitoring requirements, including threshold criteria, outlined by the Upgrader *Water Act* licence and *Environmental Protection and Enhancement Act* approval.
- b. StatoilHydro will comply with effluent monitoring requirements, including threshold criteria and test methods, outlined by the Upgrader *Water Act* licence and *Environmental Protection and Enhancement Act* approval.
- c. For Phase 1, the high total dissolved solids (TDS) stream is projected to be less than 2,000 mg/L and therefore the organic waste stream is not expected to be required for dilution.
- d. For the Project excluding Gasification 2, reverse osmosis reject and ion exchange regen waste will be segregated for evaporation treatment, while blended boiler and cooling tower blowdown streams will be discharged to the river, with a projected TDS concentration of approximately 1,717 mg/L. Therefore, the organic waste stream is not expected to be required for dilution.

86	<p>Volume 1, Section 6.4, Page 91 and Volume 3, Section 7.7, Page 7-40 The Terms of Reference, item 3.5.3 b), states <i>Provide a Wastewater Management Plan to address... those waste substances produced by the Project that are reportable under the National Pollutants Release Inventory (NPRI), Priority Substances List 1 (PSL1), Priority Substances List 2 (PSL2), and/or Accelerated Reduction and Elimination of Toxics (ARET) substances relevant to the Project.</i></p>
	<p>a. Provide the required information.</p>

Response

- a. A list of all substances evaluated for the Project is presented in [Table 86-1](#) below. Each substance is categorized into NPRI, PLS1, PLS2, or ARET substances.

Table 86-1 Substances Evaluated for the Project Categorized for Government Reporting

87	Volume 3, Section 6.5.2.1, Page 6-5 and Volume 3, Section 7.2.2, Figure 7.2-1, Page 7-3 Statoil states <i>The Project area drains into Beaverhill Creek via Astotin Creek and an intermittent unnamed tributary stream.</i> Figure 7.2-1 displays all the water sample locations within the LSA. It appears that the unnamed tributary was not sampled.
	a. Provide Statoil's rationale for not sampling the unnamed tributary.

Response

- a. There was no flow in the Unnamed Creek in the vicinity of the Project during the observation and sampling periods.

88	<p>Volume 3, Section 6.6.1, Pages 6-19 to 6-20</p> <p>Statoil states <i>Runoff water will be controlled via berms and ditches... These will be designed to provide full containment and use of runoff water in the Upgrader process. In addition, Statoil states On occasion, if the water meets regulatory requirements for release, the three storm water ponds in the north and east undeveloped areas... could have managed releases to enhance and maintain water levels in the wetland areas to the north.</i></p> <p>a. Confirm what the source material for the berms will be and whether the material is suitable for the purpose it is being used for.</p> <p>b. Clarify if Statoil plans to construct a perimeter ditch around the entire Project Area. If so, describe where and how the ditch will receive and discharge water.</p> <p>c. Explain how Statoil will release the water from the raw water ponds to the natural wetlands.</p>
----	--

Response

- a. The source material for the berms will be lower subsoil till material (not including the salvaged upper subsoil or topsoil). The till lower subsoil texture varies from sandy clay loam to clay and is suitable for the purpose.
- b. An external perimeter ditch outside of the bermed area is not planned. However, run-off outside the berms will be directed to existing swales and ditches along roads and railways through site grading. The purpose of the berms is to provide a visual and sound barrier and not to contain stormwater within the Upgrader site. The site will be graded to drain all collected stormwater within the berms to stormwater collection ponds with a series of ditches.
- c. The water from the Raw Water Pond will not be released to the wetland. Stormwater runoff acceptable for discharge will be diverted to the natural wetlands in a controlled manner using the Range Road ditches that drain to the northern wetland complex. [SIR Response 52](#) and [SIR Response 69](#) provide additional details.

89	<p>Volume 3, Section 7.5.3.2, Page 7-12</p> <p>Statoil states <i>Development beyond 243,000 bpsd with Gasification 1 will incorporate zero liquid discharge technologies (ZDT) for treatment of all waste streams, which will eliminate loadings to the NSR under normal Upgrader operations.</i></p> <p>a. Provide a discussion as to what will occur to the waste streams during upset conditions.</p>
----	---

Response

- a. During an upset, waste streams will be segregated and stored to avoid discharge to the North Saskatchewan River. Depending on the severity of the upset, excess wastewater will be stored either in a suitable pond or tank for gradual processing, or possibly disposal to deepwell.

90	<p>Volume 3, Section 7.5.3.2, Table 7.5.3, Page 7-12</p> <p>Statoil plans to release treated water to the North Saskatchewan River. Recently selenium has been noted in the process water discharge from an upgrader in the area. It is noted that selenium has not been measured as part of the baseline conditions in the North Saskatchewan River. (Table 7.6-1)</p>
	a. Identify all the water streams that might contain selenium.
	b. Identify the sources of selenium and its disposition.
	c. Discuss Statoil's plans to monitor selenium concentrations in the process and discharge water.
	d. Discuss Statoil's plans to monitor selenium concentrations, loading, and ecological effects in water, sediment, and organisms within the North Saskatchewan River and clarify if Statoil's monitoring plan will include periodic sampling of fish in the vicinity of the proposed effluent outfall for the bio accumulation of metals.
	e. What has Statoil done or what will Statoil do to ensure selenium does not become an issue for this project?
	f. If Statoil determines selenium is an issue what contingency plan will Statoil implement to further reduce selenium loading to the North Saskatchewan River during low flow or peak loading conditions?

Response

- a. Selenium may be present in the stripped sour water and to a minor extent in the desalter washwater.
- b. Selenium in the stripped sour water and the desalter washwater is believed to originate from the bitumen. Raw water taken from the North Saskatchewan River may also contain selenium. StatoilHydro, along with other industry partners, are studying the disposition of selenium.
- c. StatoilHydro plans to monitor the selenium levels in the bitumen, washwaters, raw water inlet stream and combined effluent discharge.
- d. StatoilHydro will continue to work with industry partners and Alberta Environment to monitor potential effects of selenium on water, sediment, organisms and fish in the North Saskatchewan River. StatoilHydro has no current plans for an independent metals monitoring program in the North Saskatchewan River.
- e. StatoilHydro, along with other industry partners, are studying the disposition of selenium. StatoilHydro will investigate treatment options for selenium if concentrations are found to be of concern and may also choose to accelerate the program to Zero Liquid Discharge to eliminate selenium discharge to the River.
- f. See the response to Part e above.

91	Volume 3, Section 7.9, Figure 7.2-1, Pages 7-3 and 7-69 In the <i>Follow-up and Monitoring</i> section, there is no indication that monitoring will be conducted at the locations where baseline water samples were taken (Figure 7.2-1).
	a. Discuss whether a water quality monitoring program of these waterbodies and watercourses will be undertaken for early detection of contamination and identify whether testing will include the same parameters used for determining baseline conditions.
	b. Provide a discussion of surface water remediation options to be implemented in the event adverse effects are detected.

Response

- a. StatoilHydro is not contemplating further sampling at the locations where baseline water samples were taken. StatoilHydro will not discharge effluent into any waterbody or watercourse other than the North Saskatchewan River.
- b. In the event that adverse impacts to surface water are detected, an incident-specific plan would be developed and implemented. The remediation options chosen would depend on the type and magnitude of the adverse effect identified, and on the characteristics of the impacted waterbody.

92	Volume 3, Sections 7.5.3.2 and 7.7.5, Pages 7-13 and 7-44 to 7-45 Statoil uses the Cornell Mixing Zone Expert System model for examining the effects of treated effluent discharge in the LSA. The reasons for using the model and the assumptions are provided.
	a. In accordance with the Terms of Reference, item 4.3, what are <i>the limitations of the model and the data used in the model including sources of error and relative accuracy?</i> Provide appropriate references as required.

Response

- a. The CORMIX model is supported by the United States Environmental Protection Agency (U.S. EPA) and has been successfully applied to numerous dilution scenarios in a large number of environments including estuaries, rivers, open oceans, and lakes. The CORMIX information website (<http://www.cormix.info/applications.php>) provides numerous examples of the model's applications. Limitations of the model have been discussed in several publications including recent publications by Schreiner et al. (2002) and Palmer (2001). The principal limitation reported by these studies concerned the tendency of the model to over-emphasize the mixing of a plume for complex discharges and complex ambient environments which could result in a smaller modelled plume than would actually be measured. This effect does not apply to the relatively simple case of effluent discharge to a river as in the case of StatoilHydro's proposed discharge to the North Saskatchewan River. For simple delineation of the mixing zone of an effluent plume, CORMIX is the model of choice by both the U.S. EPA and Alberta Environment. The CORMIX model is considered entirely suitable for this application.

The input data used for the model were those reported by StatoilHydro and represent the current effluent chemistry at the time of modelling. In addition, the effluent loadings used in the model were those predicted for a peak summer day under the Project case excluding Gasification 2 and hence represent worst case conditions. A very low flow in the North Saskatchewan River (the 7Q10), representing minimal dilution, was also applied in the model. The CORMIX model applied to StatoilHydro's proposed effluent discharge to the NSR, therefore, provided very conservative results.

Response

a. Model Overview

WASP is a generalized modelling framework based on the finite-volume concept for quantifying fate and transport of water quality variables in surface waters. The three components of the model are WASP for mass transport; EUTRO for dissolved oxygen, nutrients, and algal kinetic; and TOXI for toxic substances. WASP is capable of analyzing time-variable or steady state, one-, two-, or three-dimensional water quality problems. The WASP model has been widely applied to investigate dissolved oxygen, bacteria, eutrophication, suspended solids, and toxic substance problems. United States Environmental Protection Agency (U.S. EPA) WASP is a technically defensible tool that is routinely used in the development of total maximum daily loads (TMDL), waste load allocations, and watershed protection plans. Development on U.S. EPA WASP is very active and new features are in development.

In this study, the WASP model used was essentially the same as that used by other facilities (Shell Scotford, North West Upgrader; Petro-Canada Oil Sands Inc. Sturgeon Upgrader). The model was configured to simulate water chemistry within the North Saskatchewan River using 440 surface water segments along the modelled 60 km reach of the regional study area. The model was run under $7Q_{10}$ conditions ($60 \text{ m}^3/\text{s}$), representing a conservative dilution scenario. River hydraulic conditions were approximated using Leopold-Maddock coefficients developed for the North Saskatchewan River (Ray and Dykema, 1991). Dispersion coefficients were assumed constant across the channel at all locations and a river temperature of $1.0 \text{ }^\circ\text{C}$ was applied.

The calibration procedures for the model match those used by an analogous facility and consisted of adjusting lateral dispersion coefficients so that simulated dye concentrations matched the results of an earlier modelling study by Golder (1995). To verify the performance of the calibrated WASP model for the North Saskatchewan River, the model was applied to simulate recently measured water quality parameters in the North Saskatchewan River.

Loadings of total phosphorus and sodium for most municipal and industrial dischargers to the North Saskatchewan River were those obtained for the

loading analysis described in the environmental impact assessment and represent real effluent monitoring data reported to Alberta Environment.

Conceptual Basis/Model Assumptions

The waterbodies in WASP are conceptualized as well-mixed control volumes, and the law of conservation of mass is applied to each. The governing equations for the WASP model are the advection-dispersion-reaction equations for the water quality variables. The WASP module provides the advection and dispersion solutions and the EUTRO and TOXI modules provide the reaction solutions of dissolved oxygen, nutrients, and algae. A one-step Euler solution technique is applied for the time difference. The advection terms in the governing equations are solved with UPWIND difference in space. The water quality variables can be turned on/off depending on modeling requirements.

The following model limitations are provided by the U.S. EPA.

- Each control volume (segment) is assumed to be instantaneously mixed.
- WASP requires an external hydrodynamic model to provide a flow file for solving advection (in our steady state case, flow was assumed to be constant at the 7Q10.)
- User specified dispersion coefficients and temperature are required.
- First-order UPWIND difference in space may cause significant numerical diffusion.
- Over-simplified sediment flux calculation.
- No periphyton or macroalgae component is available.
- Sediment transport processes are not related to shear stress.

In applying the WASP model for StatoilHydro, the principal assumption was the validity of the input loading data from each municipal and industrial facility. As indicated in [Volume 4, Section 7.7.6.2, Tables 7.7-5 and 7.7-6](#), the input loading data were derived from actual monitoring data reported to Alberta Environment or, in the case of recently approved facilities, from the predicted effluent chemistry presented in each impact assessment. While a high degree of accuracy can be assumed for the loadings derived from the Alberta Environment monitoring data, StatoilHydro has less confidence in the predicted loadings from the approved (but non-operational) facilities. These facilities have not yet been built and the predicted loadings were the only ones available. The close correlation between the incremental increases predicted by WASP in the average concentration of chloride in the North Saskatchewan River (e.g., [Volume 4, Section 7.7, Figure 7.7-6](#)) and the increases in concentration obtained from the mass balance calculations in [Volume 4, Section 7.7.5.2, Table 7.7-3](#) supports StatoilHydro's confidence in the results of the WASP modelling.

94	<p>Volume 1, Sections 1.5.2 and 4.3, Table 4.3-1, Pages 9-10 and 52 and Volume 3, Sections 7.5.3.2, 7.8 and 7.10, Tables 7.10-1 and 7.5-3, Pages 7-11, 7-12 and 7-69 to 7-71</p> <p>Throughout the Surface Water Quality Section, Statoil refers to ZLD to the North Saskatchewan River that will be phased in with the gasification component of project development. In Volume 1, Section 1.12, Page 12, Statoil states <i>the implementation of gasification is dependent on its financial viability in relation to prices of natural gas and carbon credits.</i></p>
	<p>a. Given the uncertainty of gasification, is the implementation of ZLD contingent on gasification, or will it be implemented in the absence of gasification? If it can be implemented in the absence of gasification, provide Statoil's rationale for not implementing ZLD during Phase 1 of development.</p>
	<p>b. In the absence of ZLD at project completion, are the conclusions presented in Volume 3, Sections 7.8 and 7.10 still valid? If the conclusions are no longer valid, how might the effects of the project on surface water quality be altered, particularly with respect to cumulative effects on the NSR?</p>
	<p>c. In the absence of gasification and ZLD:</p> <ul style="list-style-type: none"> i) What will be the volume and composition of water discharged to the NSR? ii) Clarify if this eventuality constitutes the worst case scenario, as opposed to the project (excluding Gasification 2) shown in Table 7.5-3. iii) What volume of water will be withdrawn from the North Saskatchewan River? Update Table 4.3-1 accordingly.

Response

- a. The cessation of discharges to the North Saskatchewan River is contingent on Gasification 2. Should this gasification phase not proceed, StatoilHydro will implement evaporative treatment of targeted high total dissolved solids (TDS) wastewater streams and Biox effluent reuse to reduce discharges to the river and reclaim water for re-use.

Zero liquid discharge (ZLD) will not be implemented in the first phase of the project in order to improve definition of the waste streams and allow piloting of the reclamation processes.

- b. At Project completion, without Gasification 1 and 2, evaporation of some high TDS streams is required to meet the water balances presented in the Application and operate the Project, as presented in [Volume 1, Section 4.3, Table 4.3-1](#) and updated in [SIR Response 81](#).

The conclusions presented in [Volume 3, Sections 7.8 and 7.10](#) still represent the maximum effluent loading condition which occurs after Gasification 1. Therefore, the conclusions presented are still valid.

- c.
- i. To achieve 243,000 bpsd without gasification or use of ZLD or evaporation of any high TDS streams (but including recycle of organic Biox effluent), a river withdrawal and discharge of 18,439 m³/d and

6,729 m³/d, respectively, would be required without the 15 percent contingency. This is higher than the river discharge amount requested in the EIA Application and updated in [Table 5.3-1 in SIR Response 81](#). Therefore, the project could not proceed without partial evaporation and the scenario suggested in [SIR 94](#) is not considered feasible. The potential composition of this river discharge is presented in [Table 94-1](#).

Table 94-1 StatoilHydro Upgrader River Discharges (Without Contingency)

Project Phase	The Project (excluding Gasification 1 & 2, no evaporation)	The Project (excluding Gasification 2)
Flow (m ³ /d)	6,728.5	3,305

- ii. As shown in [Table 94-1](#) above, this scenario would represent the maximum loading condition for some parameters. However, as stated above this scenario is not feasible within the river discharge volumes requested.
- iii. See the response to [Part i](#), above. As this scenario is not feasible under the river discharge volumes requested, [Table 4.3-1](#) has not been updated to include this case.

95	<p>Volume 3, Section 8.9, Table 8.9-1, Page 8-37</p> <p>Statoil has described the predicted extent of the impact of changes to water levels, flows and drainage patterns and nutrient enrichment as local in extent.</p> <p>a. Describe how Statoil arrived at this conclusion if the effluent plume will persist for at least 1.29 km downstream of the effluent outfall and the effect of changed flow and water levels will occur throughout the RSA.</p>
----	---

Response

- a. In the water quality section ([Volume 4, Section 7.7.5.2](#)) the effects of discharge are actually treated as regional in extent rather than local. The following is the relevant excerpt from this section:

The residual effects of the discharge of treated effluent on the LSA will be negative in direction, regional in extent, low in magnitude, medium-term in duration, continual in frequency and reversible in the median term. The residual effects will be low in magnitude because the incremental increases in certain water quality parameters attributable to the Project are within acceptable protective standards. The confidence in this prediction is high. The residual effects of the discharge of treated effluent on the NSR have an overall impact rating of low.

96	<p>Volume 1, Section 3.5.1.2, Page 28</p> <p>Statoil states <i>An emergency petcoke storage area (e.g., in case of a rail disruption) will be available to contain approximately three weeks worth of coke production. The emergency storage area will be designed to protect oil and groundwater from contamination.</i></p> <p>a. Provide details on the design measures to protect soil and groundwater from potential petcoke contamination from the emergency petcoke storage area.</p>
----	---

Response

- a. To protect soil and groundwater from potential petcoke contamination, the emergency storage area will be sited in suitable soil conditions where the hydraulic conductivity is less than or equal to 10^{-9} m/s. Should the site soil deposits not meet this condition a compacted clay liner or an impervious synthetic liner system will be considered. A perimeter berm consistent with the storage area floor design will be placed to contain potential petcoke impacts and prevent surface water run on. Water released from the petcoke as part of its normal drying process as well as rain water will collect in a central sump. The water from this sump will be pumped back to the petcoke handling facilities at the delayed coker unit (DCU) where it will be treated and re-used as wetting water for the dust suppression system and water for the petcoke cutting system. Excess water related to severe storm events will be sent for treatment in the wastewater treatment system.

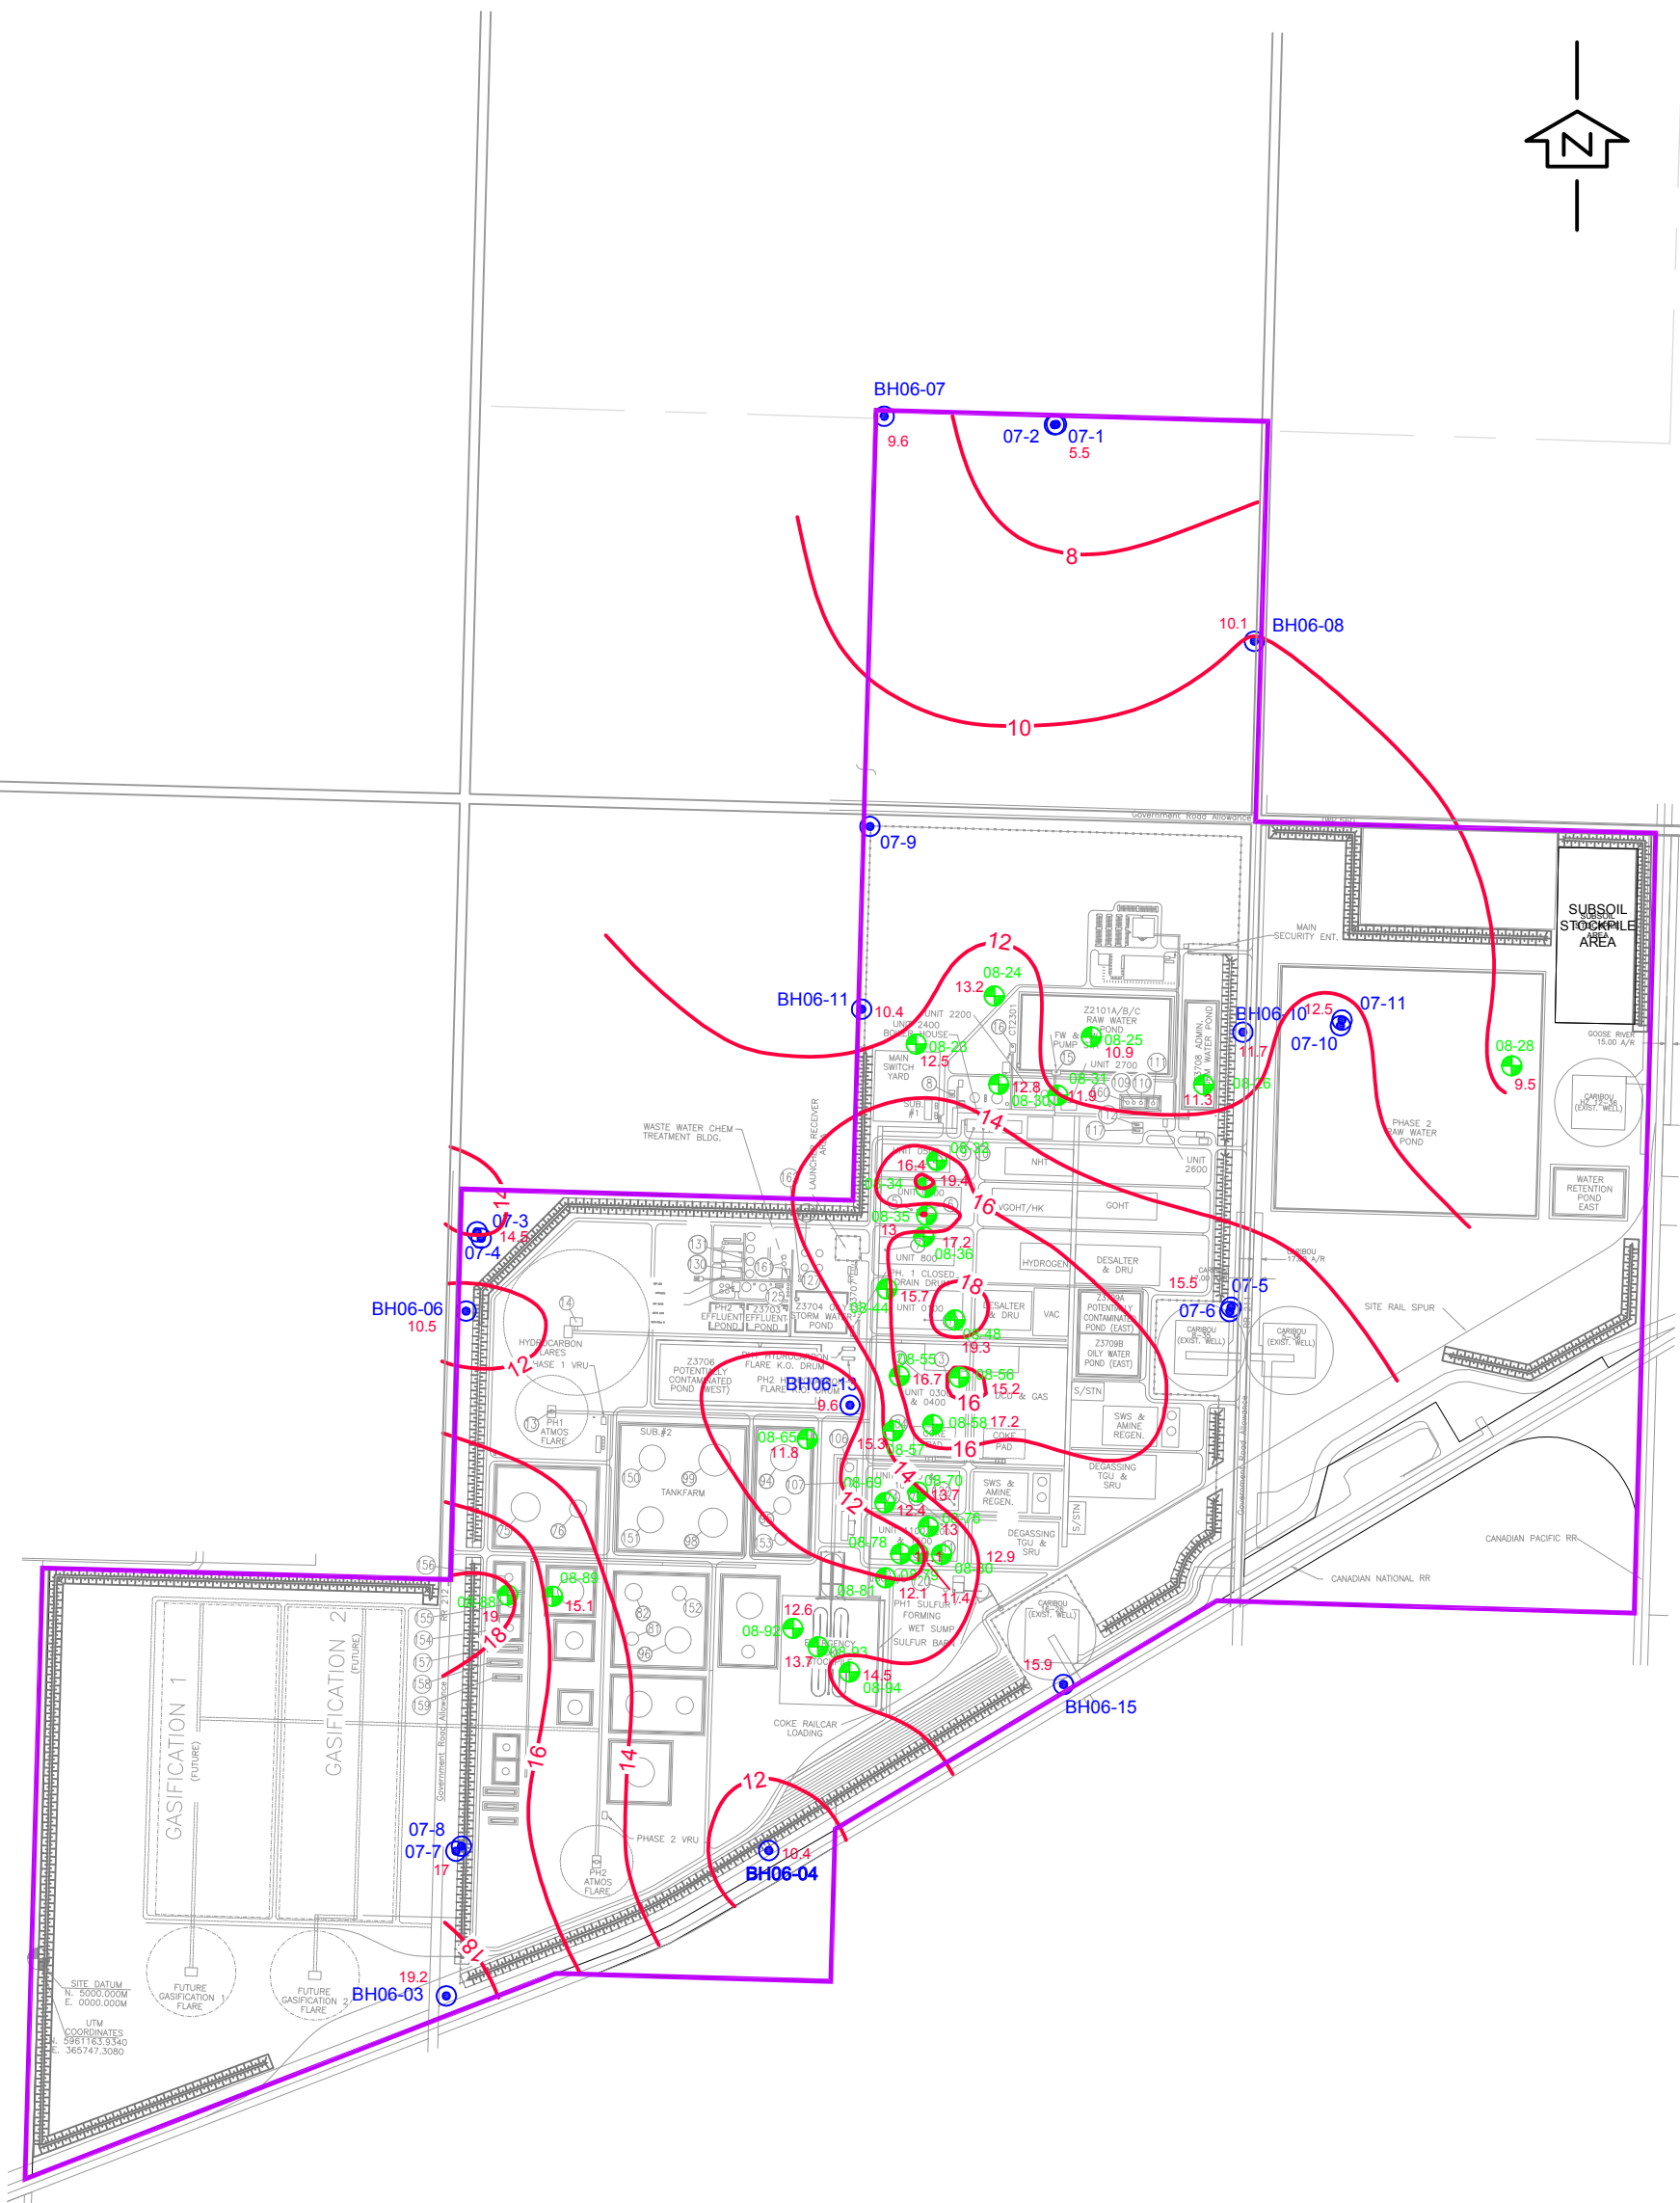

97	<p>Volume 3, Sections 5.3 and 5.6.3, Pages 5-4 and 5-42</p> <p>Statoil states <i>through the construction and operation phases of the Project, components which have the potential to affect groundwater resources include:</i></p> <ul style="list-style-type: none"> • <i>The operation of surface facilities</i> • <i>Dewatering of excavations during construction of the Upgrader; and</i> • <i>Groundwater withdrawal under the potentially contaminated pond and oily water pond during the operation of the Project. Statoil states that the base of the potentially contaminated and oily water ponds are not expected to extend below the base of the clay till.</i>
	a. What will the depth of the excavations be during construction?
	b. Provide the thickness of clay till depth to Sand and Gravel Aquifers at the proposed pond locations.
	c. Provide the anticipated depth of the ponds and the remaining thickness of clay below each pond after construction.

Response

- a. Based on information presented in the Application, the maximum depth of excavation during construction will be 6.1 m at the petcoke pad, the oily water pond, and the potentially contaminated pond.
- b. The thickness of the clay till unit overlying the lower sand and gravel aquifer is estimated from borehole logs at or near the pond locations. The estimated thickness of the clay till unit at each pond is listed in [Table 97-1](#) below. At pond locations where there were no adjacent boreholes, the clay till unit thickness was interpolated from surrounding boreholes. The interpreted thickness of the clay till unit and existing boreholes are illustrated in [Figure 97-1](#).
- c. For information presented in the Application, the pond depths and estimated remaining thickness of the clay till unit below each pond are presented in [Table 97-1](#). Remaining thickness of clay till below each pond was determined by subtracting the pond depth from the thickness of the clay till unit.

Table 97-1 Thickness of Clay Till Unit at Pond Locations

Pond	Approximate Thickness of the Clay Till Unit (m)	Approximate Pond Depth (m)	Remaining Thickness of the Clay Till Unit (m)
Raw Water Pond	10.9	4.0	6.9
Effluent Pond	14	3.1	10.9

Title:
FIGURE 97-1
ISOPACH MAP OF CLAY
TILL UNIT

StatoilHydro	
Approved: TVD	Revision Date: 06/07/22
File: 6198-SP-08.DWG	
Drawn by: BSW	Checked: RP

98	<p>Volume 3, Section 5.6.1, Page 5-40</p> <p>Statoil states <i>accidental releases from ground surface pose little threat to the Beverly Channel aquifer</i> because of the low hydraulic conductivity of the clay till unit, along with the other proposed mitigative measures.</p> <p>a. Provide an isopach map of the Clay/Clay till unit overlying the Sand and Gravel Aquifer for the Project area. Include the locations of major project facilities on the map.</p>
----	---

Response

- a. The thickness of the clay till unit at the site is illustrated in [Figure 97-1](#) above.

99	<p>Volume 3, Sections 5.6.2 and 5.6.3, Pages 5-40 to 5-42 These sections outline dewatering and groundwater withdrawal as well as the predicted effects and the extent of those effects.</p> <p>a. Provide details on how the extent of water level drawdown was determined for both the Construction Phase and the Operational Phase.</p> <p>b. Clarify what the anticipated rate of water withdrawal will be during the Operation Phase to maintain water levels below the base of the ponds.</p> <p>c. Discuss the potential uses for groundwater from dewatering or operational withdrawal that have been investigated</p> <p>d. Outline any investigations into the communication between the Clay Till unit and the Sand and Gravel Aquifer. Explain how far the water level impacts will spread through the Sand and Gravel Unit, and clarify if nearby groundwater users could be impacted.</p>
----	--

Response

- a. As described in [Volume 3, Section 5.4.2.1](#), drawdown in the vicinity of the ponds during construction and operation was estimated using the method of McWhorter and Sanada (1977).
- b. Dewatering at pond locations is expected to lower the water table in the clay till unit by between 0 m and 6.1 m. The lowered water table will be maintained by an underdrain system installed below each pond. Based on the measured hydraulic conductivity of the clay till unit (1×10^{-9} m/s to 6×10^{-9} m/s), the total dewatering rate produced from the underdrain system below the ponds is estimated to be less than 10 m³/day.
- c. Groundwater from dewatering of excavations during the initial construction will be used for construction activities as indicated in [Volume 1, Section 4.3.1.4](#). During operation, groundwater from dewatering the oily stormwater pond and potentially contaminated pond areas will be discharged to the potentially contaminated stormwater pond as described in [Volume 1, Section 4.3.3](#).
- d. Hydraulic communication between the Clay Till unit and the Sand and Gravel Aquifer is discussed in [Volume 3, Section 5.5.7](#). In addition to the investigations outlined in [Volume 3, Section 5.4.1](#), more than 100 boreholes have been drilled in the Project area in 2008 to further investigate site conditions. Based on the remaining thickness of clay till below the ponds, the low hydraulic conductivity of the clay till and the downward directed hydraulic gradient, detectable changes to nearby groundwater user water levels are not expected.

100	Volume 3, Sections 5.4.1.4 and 5.8, Table 5.8-1, Pages 5-8 and 5-45 The Canadian Pacific Railway and Canadian National Railway right of ways are located adjacent to and up-gradient of the project.
	a. Why did Statoil not include polycyclic aromatic hydrocarbons and chlorophenols in their groundwater testing and monitoring program?

Response

- a. Groundwater monitoring was conducted at the Upgrader site in 2007 and 2008. In the 2008 groundwater monitoring program, polycyclic aromatic hydrocarbons (PAHs) were analyzed on all 21 groundwater samples collected. No PAHs were detected. To date, groundwater samples have not been submitted for analysis of chlorophenols. The future groundwater monitoring program will be established by StatoilHydro in conjunction with Alberta Environment requirements.

101	<p>Volume 3, Section 5.8, Page 5-45 Statoil states <i>At least one monitoring well will be located hydraulically upgradient of the site to serve as a background (control) well. The proposed monitoring well network is presented in Figure 5.8-1.</i></p> <p>a. Clarify why Statoil has not proposed any monitoring wells up-gradient (other than two wells in the southeast corner of the Providence Grain Terminal) and down-gradient of the Providence Grain Terminal and adjacent railroad tracks to determine background contamination.</p>
-----	---

Response

- a. The proposed monitoring well locations were determined based on the Project layout. The south-east well locations were intended to be located upgradient of on-site facilities only. The groundwater monitoring program, including additional monitoring well location requirements, will be finalized in conjunction with Alberta Environment.

102	Volume 3, Section 6.6.4.2, Page 6-24 The Project will result in the loss of a seasonal wetland on the project construction-site.
	a. Clarify if the wetland was assessed for presence or absence of small-bodied fish including brook stickleback or fathead minnow. If so provide the assessment. If not, describe the evidence that suggested this assessment was not required as part of the aquatic resource assessment outlined in the Terms of Reference.

Response

- a. The wetland was visited during four seasons as part of the baseline assessment to assess the presence of surface water and the area's viability as potential fish habitat. Water was not present in the seasonal wetland at any time during the field assessments, and a lack of visible surficial connectivity to other watercourses or waterbodies was observed. Sampling the wetland for the presence and absence of fish was therefore not completed.

103	Volume 3, Section 7.7.4.5, Page 7-44 Nutrient rich effluent discharges may have the effect of attracting foraging fish. a. Comment on the potential for increased risk of fish mortality associated with the intake as a result of attracting fish to the nearby effluent stream.
-----	--

Response

- a. StatoilHydro acknowledges that effluent discharge has the potential to attract forage fish in receiving waters. The analysis of the effluent discharge indicated that the levels are expected to be within regulatory guidelines (Canadian Council of Ministers of the Environment [CCME], 2006), with the exception of nutrient levels. Background nutrient levels in the North Saskatchewan River currently exceed CCME Guidelines. Considering that water for the Project will be sourced from the North Saskatchewan River, nutrient levels in the effluent are expected to be equivalent to or slightly above background levels during Project discharge and in relation to cumulative discharge within the area. Negative effects related to fish health or abundance resulting from attraction are not expected to occur. Fish mortality associated with the intake structure will be mitigated against during the design process. For example, the screen openings will be sized in accordance with regulatory guidelines to prevent fish impingement, as stipulated in the End of Pipe Guidelines for anguillaform fish species (Department of Fisheries and Oceans (DFO), 1995).

104	<p>Volume 3, Sections 8.4.3.1 and 8.6.1, Pages 8-5 and 8-26 Statoil proposes to withdraw water from and discharge effluent to the North Saskatchewan River yet fish and fish habitat sampling was limited to a single sampling site on the North Saskatchewan River.</p> <p>a. Provide Statoil's rationale for limiting sampling to one site and concluding that a single sampling site could account for site variability.</p> <p>b. What criteria did Statoil apply when selecting the sampling site location?</p> <p>c. Explain why fish and fish habitat assessments were not undertaken at the proposed water intake site.</p> <p>d. Why was the fall fish community assessment at the North Saskatchewan River sampling site limited to minnow traps when vulnerability of most riverine species to Gee traps is low and many species are scattered for pre-winter foraging or migration to overwintering habitat?</p> <p>e. Provide justification for selecting northern pike as an indicator species when walleye, sauger and lake sturgeon are all resident to the North Saskatchewan River and have been identified by Alberta Sustainable Resource Development, Fisheries Management Branch as species of concern under Provincial or Federal Species at Risk legislation.</p>
-----	---

Response

- a. StatoilHydro's rationale for limiting sampling locations on the North Saskatchewan was based on two main considerations:
- the specific location of the river water intake had not been selected at the time of the baseline assessment; and
 - the abundance of historical fish and fish habitat information in existence from recent upgrader project reports in the region.

The water intake will be subject to separate regulatory applications. StatoilHydro will conduct a detailed fish and fish habitat survey once the intake location is finalized. This survey will include seasonal fishing, detailed habitat mapping and evaluation and an analysis of in-situ water chemistry. Following the detailed fish and fish habitat assessments StatoilHydro will submit the required regulatory applications to Fisheries and Oceans Canada, Transport Canada, Alberta Sustainable Resource Development and Alberta Environment.

- b. The selection of the sampling site location for water quality and fish and fish habitat was based on flow patterns in the vicinity of the potential Upgrader site via Astotin Creek to Beaverhill Creek and ultimately into the North Saskatchewan River. The North Saskatchewan River sampling location was located downstream of the confluence with Beaverhill Creek to establish baseline levels downstream of the potential Upgrader location and downstream of the potential water intake/effluent discharge location.
- c. See the response to Part a, above.
- d. See the response to Part a, above.

- e. Northern pike use a large variety of habitat (riverine and lacustrine) and were considered more of a generalist species. The species selected (Northern pike, white sucker, and brook stickleback) were expected to be more commonly found in the regional study area. With the exception of the North Saskatchewan River, the majority of the sampling sites did not contain suitable habitat for walleye, sauger, or lake sturgeon. The targeting of more sensitive species such as walleye or sturgeon for long term study may result in adverse affects on the population over an extended period of time.

105	<p>Volume 3, Section 8.5.4.5, Page 8-21</p> <p>Lake sturgeon, a listed species under Federal and Provincial legislation, forages in the North Saskatchewan River within the LSA.</p> <p>a. Provide the results of any assessment or research conducted by Statoil to determine the suitability or unsuitability of the proposed water intake site as foraging or overwintering habitat for lake sturgeon. If no assessments were conducted explain why Statoil concluded they were not necessary.</p> <p>b. Provide an estimate of the percentage of deep water (4+ m) habitat within the LSA that will be lost to the intake footprint.</p>
-----	---

Response

- a. As part of a separate regulatory application (see [SIR Response 104](#)), StatoilHydro will conduct a detailed fish and fish habitat assessment on the North Saskatchewan River when a location for the intake is finalized. The purpose of that assessment will be to determine the foraging and overwintering habitat potential for lake sturgeon and other species in the area of the proposed water intake site.
- b. An estimate of the percentage of the specific amount of deep water habitat (>4 m) within the LSA that will be lost to the intake footprint will be provided at the time of the assessment described in Part a.

106	Volume 3, Section 8.6.3.2, Page 8-28 Explain why the North Saskatchewan River was not considered a candidate for hydrologic monitoring for changes in flow and level when it is within the LSA and RSA and has fish habitat potential.
-----	--

Response

The North Saskatchewan River has reliable long-term flow and level monitoring data at Edmonton. The added data for any short-term period within the site would be of little supporting value to the assessment presented.

107	<p>Volume 3, Section 8.6.4.3, Page 8-33</p> <p>The intake water line and effluent discharge diffuser will be constructed in close proximity to each other.</p> <p>a. Clarify if the two lines will be installed in an open cut common trench. If not, provide an explanation why two separate trenches are being considered.</p>
-----	---

Response

- a. The outfall is located 50 m downstream of the intake. It is not recommended to combine the intake conduits and discharge piping in a common trench due to excessive river bank disturbance.

108	<p>Volume 3, Sections 8.6.4.4 and Section 8.7, Pages 8-35 and 8-36 Statoil states <i>Conservative water quality modeling (Volume 3, Section 7)</i> indicates that project effluent may increase the concentration of nutrients above CCME guidelines for aquatic life in the NSR under the fully mixed condition. It is important to note that background levels of nutrients in the NSR specifically total phosphorous and nitrites, already exceed CCME guidelines (Volume 3, Section 7.5.4.2). However, in Section 8.7 Statoil states that no cumulative effects assessment is warranted as no cumulative effects are anticipated.</p>
	a. Clarify the apparent discrepancy.
	b. What measures will Statoil take to meet Canadian Council of Ministers of the Environment (CCME) guidelines?
	c. When will these measures be implemented?
	d. What level of reduction is predicted?

Response

- a. In the Surface Water Quality section of the Application (**Volume 3, Section 7**), StatoilHydro predicts that at the end of the mixing zone the concentrations of total phosphorus will be 0.071 mg/L compared with a background concentration of 0.069 mg/L. For total nitrogen, the corresponding concentrations are 1.38 mg/L and 1.14 mg/L, respectively. The increase in total nitrogen is due largely to reduced forms of nitrogen other than ammonia. At full mixing, the two concentrations will be either indistinguishable from background concentrations or well within seasonal variability. These nutrient-related effects of the Project would be largely undetectable. However, measurable incremental increases in major ions (sodium, chloride) are predicted. As a result of these measurable effects, the cumulative effects rating of “low” was applied to the issue of effluent discharge in **Volume 3, Section 7.8.3**. The cumulative effects of effluent discharge were therefore assessed in **Volume 3, Section 7.8.3**.
- b. Background total nitrogen (1.14 mg/L) and total phosphorus (0.069 mg/L) concentrations in the North Saskatchewan River will prevent StatoilHydro from meeting the Canadian Water Quality Guidelines for the Protection of Aquatic Life (CCME, 1999 [2006 updates]) at the end of the mixing zone. With the implementation of zero liquid discharge (ZLD) for the Project, the CCME criteria will no longer apply.
- c. See the response to Part b above.
- d. For the Project case, StatoilHydro discharges to the North Saskatchewan River will be eliminated.

Reference

Canadian Council of Ministers of the Environment. 1999. Canadian water quality guidelines for the protection of aquatic life: Introduction. In: Canadian environmental quality guidelines, 1999, Canadian Council of Ministers of the Environment, Winnipeg.

109	Volume 3, Section 8.7, Page 8-36 Statoil predicts the cumulative impacts to fish and fish habitat for their and other existing and future projects will be low and localized to each project's intake or outfall.
	a. Explain how fish species known to undertake lengthy migrations including walleye, goldeye and lake sturgeon were considered in this prediction.

Response

- a. The analysis of the effluent discharge indicated that the levels are expected to be within regulatory guidelines (Canadian Council of Ministers of the Environment (CCME) 2006), with the exception of nutrient levels. Nutrient levels are predicted to be slightly above CCME guidelines but equivalent to or slightly above background levels within the North Saskatchewan River during Project discharge and in relation to cumulative discharge within the area. No negative effects on fish by an interruption or disruption of migration patterns through attraction to possible nutrient-rich effluent are expected to occur during Phase 1, through to the final phase of zero liquid discharge (ZLD), at which point there will be no nutrient discharge associated with the Project. Fish mortality associated with the intake structure are expected to be prevented by designing the screen openings to be within regulatory guidelines to prevent fish impingement, as stipulated in the End of Pipe Guidelines for anguillaform fish species (DFO, 1995). The intake structure does not pose a physical barrier in the North Saskatchewan River and should not impede fish migration.

- Department of Fisheries and Oceans (DFO), 1995. Freshwater Intake End-of-Pipe Fish Screen Guideline. Department of Fisheries and Oceans. Ottawa, ON.

110	Volume 3, Section 8, Pages 8-1 to 8-39 With the exception of the possible water intake in the North Saskatchewan River, confirm that there are no other aspects of the project or the project footprint that are likely to directly result in a Harmful Alteration, Disruption or Destruction of fish habitat.
-----	--

Response

A review of the proposed Project infrastructure indicates that there will be no road (e.g., bridges or culverts) or watercourse crossings (e.g., pipeline, telecommunication lines, etc.) and the Project footprint will not result in the Harmful Alteration, Disruption or Destruction of fish habitat. The potential for sedimentation of nearby watercourses or waterbodies will be mitigated by implementing a sediment control plan during construction and during operation.

HEALTH

111	Volume 1, Section 10.5, Table 10.5-1, Page 133 Statoil states <i>Long-term exposure to the modeled air quality values for the project is not deemed critically detrimental for wildlife.</i>
	a. Provide evidence to support this conclusion. In the response consider wildlife or livestock response to chemical exposures from the project.

Response

- a. Evidence to support this statement was provided in the screening level ecological risk assessments for terrestrial wildlife completed for the Shell Scotford Expansion Project application (Shell, 2005), the Shell Scotford Upgrader 2 Project application (Shell, 2007), and the Petro-Canada Oil Sands Inc. (PCOSI) Sturgeon Upgrader application (PCOSI, 2007). Additional evidence was offered in the livestock health risk assessment that was also conducted for the Sturgeon Upgrader application (PCOSI, 2007).

112	Volume 2, Section 2.6.1.1, Page 2-21 Statoil states <i>Fugitive dust emissions can be further reduced by chemical stabilization for semi-permanent or relatively long-term unpaved roads or parking lots.</i>
	a. Explain what Statoil means by <i>chemical stabilization</i> .
	b. If Statoil decides to use this as a mitigation measure, an assessment of the potential environmental and human health effects associated with chemical stabilization of unpaved roadways is required.

Response

- a. If necessary for dust suppression, StatoilHydro will apply a calcium chloride in water solution to unpaved roads and parking areas. Chloride compounds attract and absorb moisture from the atmosphere. This process significantly reduces the evaporation of moisture from the atmosphere and therefore reduces dust emissions.
- b. Calcium chloride solution is the dust suppressant specified by Alberta Transportation for use on gravel roads (Tougher, 2008, personal communication). It is used throughout the province. No environmental or health risk assessment is warranted for this commonly used product.

Reference

Tougher, Dave. Alberta Transportation, Roads and Highways. Personal Communication. Telephone conversation on August 14, 2008.

113	Volume 2, Section 2.6.2.2, Page 2-23 Statoil states <i>Based on the Upgrader design, the annual average SO₂ emissions are expected to be 7.18 t/d, based on a sulphur recovery efficiency of 99.8%.</i>
	a. Clarify if the predicated SO ₂ ground-level concentration was assessed at a sulphur recovery efficiency of 99.5 per cent as per EUB ID 2001-03. If not provide the assessment.

Response

- a. SO₂ emissions are expected to vary with time. On a short term basis, higher SO₂ concentrations could potentially occur due to intermittent abnormal operating conditions. The assessment of SO₂ concentrations due to the Project adopted an approach that used higher SO₂ emission rates to represent these short term situations, and used the annual value to represent long term concentration changes.

As indicated in [Volume 2, Section 2.7.1.1, Table 2.7-1](#), an SO₂ emission rate of 18.14 t/d was used to predict 1-h and 24-h average concentrations; this emission rate corresponds to a 99.5% sulphur recovery for all the SRU/TGTU plants. An emission rate of 7.34 t/d was used to predict annual average SO₂ concentrations and PAI deposition; this emission rate corresponds to 99.8% sulphur recovery for all the SRU/TGTU plants. [SIR Response 22](#) shows the potential acid input (PAI) deposition based on 99.5% sulphur recovery for the Project.

114	<p>Volume 2, Section 2.7.1.2, Page 2-35</p> <p>Statoil assesses SO₂ emissions based on 10 different scenarios. Case A refers to 99.8 per cent sulphur recovery. Statoil states <i>Normal Project SO₂ emissions are expected to be represented by Case A.</i></p> <p>a. Provide evidence to support this prediction.</p>
-----	--

Response

- a. An average annual sulphur recovery of 99.8% is achievable for a well run facility. The design predicts 150 ppm sulphur in the tail gas treating unit (TGTU) tail gas, which equates to 99.94% overall recovery. This would allow a ten day bypass of the TGTU to meet the annual average recovery of 99.8%. New operating units typically make five year continuous runs with no bypassing.

Potential causes for recovery loss include:

1. **Lower Catalyst activity in the sulphur recovery unit (SRU)** - SRU catalyst is extremely rugged and inexpensive. The design calls for replacement after four years of operation when it reaches the end of life activity. The volume of catalyst is in excess of that required therefore activity is in the upper half of the bed as evident from the bed temperature profiles. Loss of activity shifts the bed temperature rise to the lower end of the bed. The operator will be able to clearly monitor the catalyst activity and prepare for replacement earlier if required. The TGTU design is based on the end of life activity with a suitable design allowance.
2. **Reduced SRU efficiency due to a non-optimum H₂S to SO₂ ratio** - Another cause of low sulphur recovery is the frequent occurrence of the H₂S to SO₂ ratio moving off optimum due to a malfunctioning air demand analyzer. The StatoilHydro design uses highly reliable thermal conductivity analyzers to monitor residual TGTU H₂ as a sensitive indicator to this ratio instead of the standard H₂S/SO₂ analyzer employed in most facilities.
3. **Reduced TGTU Catalyst Activity loss** – The control scheme employed in this design effectively diminishes all causes of TGTU activity loss, further improving reliability.

115	Volume 2, Section 2.7.1.2, Table 2.7-2, Page 2-38
	For the Project-Only scenario, 1 and 24-hour AAAQO for SO ₂ is exceeded outside the PPL for both Cases I and J, and the 1-hour is exceeded for Case H.
	a. Discuss the accuracy of the predicted SO ₂ concentrations. b. Discuss proposed mitigation measures if the predicted sulphur recovery can not be attained (and SO ₂ concentrations are higher than expected).

Response

- a. StatoilHydro believes that the prediction of SO₂ concentrations are reasonable. The accuracy of the predicted SO₂ concentrations depends on the accuracy of the emission estimates and on the application of the dispersion model. The accuracy of the dispersion model with respect to predicting SO₂ concentrations is discussed in [Volume 2, Appendix 2D, Sections 2D4.2 to 2D4.5](#). The emission estimates are based on conservative design values for Case A and Cases B to H represent hypothetical abnormal operating conditions. The Case A SO₂ emissions assume all SRU/TGTU are operating simultaneously at 99.8% sulphur recovery. The design of 99.9% is based on new catalyst, and the 99.8% is the expected sulphur recovery at the end of the catalyst life. The SO₂ emissions associated with the 99.8% sulphur recovery is therefore viewed as an overall average under normal conditions that is slightly conservative.
- b. StatoilHydro expects to be operating at 99.8% recovery represented by Case A for more than 90% of the time (see [SIR Response 28](#)) as opposed to the 99.5% range represented by Case H. Although the situation is highly unlikely, if sulphur recovery cannot be maintained at 99.8%, StatoilHydro would take appropriate actions, potentially including operational changes, increased inspections and equipment redundancy.

116	<p>Volume 2, Section 2.7.1.6, Page 2-48</p> <p>With respect to SO₂ concentrations, Statoil states <i>The maximum 24-hour concentrations, on average, are underpredicted by 49%. An average difference of 49 per cent is quite large and can likely have a marked impact on predicted air and human health effects.</i></p>
	a. Explain why Statoil considers an underprediction of 49 per cent acceptable.
	b. Discuss the implications to the conclusion of the human health risk assessment.

Response

- a. The comparisons between predicted and measured concentrations were used to gauge model performance. There are a number of reasons why the model may under or over predict; and one of the challenges in providing a more rigorous gauge of the performance is that the emission profile, the meteorological data and the ambient air quality data do not reflect concurrent periods. The comparison was not intended to provide a model validation.

The largest underprediction (a bias of -61% or predicted = 0.4 x measured) is associated with the Redwater station. The SO₂ emissions used to represent the existing Redwater Fertilizer Plant were 4.1 t/d, and the maximum approved emissions are 11.4 t/d. If the plant was operating at the approved emission rate, then the predicted concentrations should be increased by a factor of 2.8. The underprediction bias of -61% combined with the application of the maximum emission rate indicates that the model could be overpredicting 24-h concentrations by 10% (0.4 x 2.8 = 1.1).

The next largest underprediction (a bias of -51% or predicted = 0.5 x measured) is associated with the Scotford station. The SO₂ emissions used to represent the existing Scotford Upgrader were 22 t/d, and the maximum approved emissions over the 2003 to 2006 time period were 46.6 t/d (2003 and 2004) and 35 t/d (2005 and 2006). If the plant was operating at an approved emission rate of 46.6 t/d, then the predicted concentrations should be increased by a factor of 2.1. The underprediction bias of -51% combined with the application of the maximum emission rate indicates that the model could be overpredicting 24-h concentrations by 6% (0.5 x 2.1 = 1.06).

Furthermore, the predicted values do not account for abnormal or upset flaring events that may have been included in the ambient data. The ambient data are for the 2003 to 2006 period. The Scotford upgrader was commissioned in mid 2003 and during this time higher SO₂ emissions likely occurred.

In summary, StatoilHydro made no judgment whether an “underprediction of 49% was acceptable”. The comparison between predicted and measured was used to provide an overall indicator of model performance. The model results generally fall within the “factor of two accuracy” indicated on [page 2D-17, Volume 2, Appendix 2D](#).

- b. The basis of the 24-h Alberta Environment ambient air quality objective (AAQO) is on vegetation effects, not human health (AENV, 2008). The 10-min and 1-h SO₂ air concentrations are of more relevance to human health than the 24-h air concentrations, and both 10-min and 1-h risk quotient (RQ) values were calculated for the acute assessment of SO₂. SO₂ is a rapidly acting irritant, with key effects occurring within the first 15 minutes of exposure in sensitive individuals. Thus, the conclusions of the human health risk assessment are not affected.

Alberta Environment (AENV). 2008. Alberta Ambient Air Quality Objectives and Guidelines: Facts at Your Fingertips. Issued June 2008. Accessed online at: <http://environment.gov.ab.ca/info/library/5726.pdf>

117	Volume 2, Section 2.7.2.3, Page 2-55 With respect to NO ₂ concentrations, Statoil states <i>The maximum concentrations, on average, are underpredicted by 31%.</i>
	a. Explain why Statoil considers an underprediction of 31 per cent acceptable.
	b. Discuss the implications to the conclusion of the human health risk assessment.

Response

- a. [SIR Response 116](#) provides a discussion that is also applicable to NO₂. The statement on [page 2-55 \(Volume 2, Section 2.7.2.6\)](#) of the Application is incorrect. It should read “*The maximum 24-hour concentrations, on average, are underpredicted by 17%.*”
- b. The potential underprediction of the daily NO₂ air concentrations are not expected to have an impact on the conclusions of the human health risk assessment.

The maximum 24-h NO₂ air concentrations for the discrete receptor groups are presented in [Table 117-1](#) below.

Table 117-1 Maximum 24-hour NO₂ Air Concentrations

Receptor Group	24-hour Air Concentrations (ug/m ³)		
	Baseline	Application	Cumulative
Agricultural	58.2	72.9	75.2
Residential/Community	79.5	79.7	81.3
Public Use Areas	87.0	87.0	87.0
Commercial/Industrial	83.9	83.9	86.3
AAAQO	200	200	200

Source: Volume 2, Section 2, Table 2.7-11

As shown, the maximum 24-h air concentrations are predicted for the cumulative case. [Table 117-2](#), below, compares the cumulative air concentrations for the environmental impact assessment against concentrations adjusted using the 17% average prediction bias ([Volume 2, Appendix 2D, Table 2D-10](#)).

Table 117-2 24-hour Cumulative NO₂ Air Concentrations Adjusted for the Potential Prediction Bias

Receptor group	Maximum 24-hour Air Concentrations (ug/m ³)	
	Original	Adjusted
Agricultural	75.2	88.0
Residential/Community	81.3	95.1
Public Use Areas	87.0	101.8
Commercial/Industrial	86.3	101.0
AAAQO	200	200

As shown, increasing the maximum 24-h NO₂ air concentrations due to a possible prediction bias does not result in exceedances of the ambient air quality objective. The adjustment in air concentrations does not have an impact on the conclusions of the human health risk assessment.

118	<p>Volume 2, Section 2.7.3.1, Page 2-56</p> <p>Statoil states <i>Short-term abnormal PM_{2.5} emissions that are greater than the values represented in Table 2.7-12 might occur under plant upset conditions, or might be associated with biogenic (e.g., biomass burning) or community sources. These events were not considered for this assessment.</i> Effects on air concentrations that are the direct result of project activities, such as upset conditions, need to be included in the assessment in order to evaluate reasonable worst-case scenarios.</p>
	<p>a. Provide an updated assessment that accounts for impacts to PM_{2.5} concentrations during an upset.</p>

Response

- a. Upset conditions can result in the intermittent short-term flaring events described in Appendix 2A (see [Volume 2, Appendix 2A, Tables 2A-29, 2A-30 and 2A-31](#)). These events were evaluated in terms of ambient SO₂ concentrations (see [Volume 2, Appendix 2E, Section 2E1.5](#)).

The United States Environmental Protection Agency (U.S. EPA) PM_{2.5} emission factor of 17 lb PM_{2.5} per million cubic feet of fuel was used to estimate PM_{2.5} emissions from the upset flaring scenarios (U.S. EPA, 1998). The maximum expected PM_{2.5} concentrations associated with each upset flaring scenario assessed in the environmental impact assessment ([Volume 2, Appendix 2E](#)) was scaled from the predicted SO₂ concentrations. Results for PM_{2.5} for the flare scenarios are presented in [Table 118-1](#) below. The maximum predicted concentrations assume that the intermittent flaring scenario and a poor dispersion condition are occurring simultaneously.

For most of the flaring scenarios, the maximum 1-h average PM_{2.5} concentration is typically 2 ug/m³ or less. There is one flare scenario (i.e., Scenario 11) where the maximum 1-h average is 3.96 ug/m³. The maximum predicted PM_{2.5} concentrations are less than the 80 ug/m³ ambient air quality guideline.

Ambient air quality monitoring measurements provide an indication of the extreme concentrations that are occurring and could continue to occur in the region. As indicated in [Volume 2, Appendix 2B, Section 2B 5.1](#), maximum measured 1-h average PM_{2.5} concentrations range from 76 ug/m³ to 326 ug/m³, depending on the Fort Air Partnership site. Corresponding measured 99.9th percentile PM_{2.5} concentrations range from 51.4 ug/m³ to 69.1 ug/m³, again depending on-site. The flare stack contribution is relatively small with respect to the higher levels that have been measured in the region.

Notes:

Flow rates and SO₂ emission rates from Volume 2, Appendix 2E1.5PM_{2.5} emissions based on 17 lb/mmdscf MethanePM_{2.5} concentrations are scaled from the predicted SO₂ concentrations.

The values for upset flaring Scenarios 13 and 14 have been updated (See Additional Errata section).

119	Volume 2, Section 2.7.3, Pages 2-56 to 2-62 Given the influence of the City of Edmonton and rural activity, it is expected that the background concentrations of PM _{2.5} may be substantial. a. What values were used to account for background concentrations of PM _{2.5} ?
-----	--

Response

- a. For the air quality assessment no background concentrations were added since the modelling captured the major PM_{2.5} sources in the region (i.e., major urban sources).

The PM_{2.5} concentration contours in [Volume 2, Section 2, Figures 2.7-20 to 2.7-24](#) confirm that the City of Edmonton may be a substantial source of PM_{2.5} emissions. A level of significant overprediction for the Edmonton air quality monitoring stations is noted in [Volume 2, Appendix 2D, Table 2D-12](#).

120	Volume 2, Section 2.7.7.1, Pages 2-71 Statoil states that “ <i>For the Application Case, the maximum predicted H₂S concentrations due to the Project exceed both the 1-hour AAAQO at 10 agricultural/residential locations and 24-hour AAAQO at two agricultural/residential locations...there are 115 hours and 119 hours of predicted exceedances of the 1-hour AAAQO for the Application and Future Cases, respectively.</i> ”
	a. Discuss the proposed response/mitigation measures available should these predicted exceedances occur.

Response

- a. The H₂S emissions were estimated by extrapolating fugitive emission profiles from a surrogate facility to the StatoilHydro Upgrader. StatoilHydro recognizes the proximity of the Upgrader to nearby residents. For this reason, StatoilHydro proposes to implement the following to reduce fugitive emissions from the Upgrader:
- Floating roofs on storage tanks
 - Vapour recovery on tanks in sour service.
 - A proactive LDAR program.

As described in [SIR Response 138b](#), StatoilHydro will implement an odour response plan.

121	Volume 2, Section 2.7.7.2, Table 2.7-25, Page 2-74 Measured concentrations of Volatile Organic Compounds (VOCs) were compared to predicted concentrations.
	a. Discuss the appropriateness of comparing predicted 24-hour averages to measured 24-hour maximum and 95 th percentiles.

Response

- a. The 24-h averaging period for both measurements and predictions are viewed as appropriate since a common time base is desirable for these type of calculations. The predicted concentrations are based on the application of industry and traffic emission factors; the predictions do not include fugitive emission variability or facility upsets. As a consequence, a greater level of uncertainty is expected for the VOC emission estimates relative to the SO₂ emission estimates that are based on detailed measurements (at least for existing sources).

For this reason, the predicted values were compared to the 95th and 100th (maximum) percentiles. In some cases there is a factor of two difference between these two percentiles, and in other cases there is up to a factor of ten difference. The large differences are likely due to intermittent/extreme fugitive emissions. These percentiles were viewed as providing a reasonable bracketing indicator of high concentrations that are occurring in the region.

122	Volume 2, Section 2, Pages 2-1 to 2-124 The air assessment focussed on SO ₂ , NO _x , PM _{2.5} , selected VOCs, and O ₃ . There was no assessment of metals emissions.
	a. Provide quantitative evidence that metals are not being released from sources associated with this project.
	b. Table 2.7-24 appears to be missing some chemicals (e.g., ammonia, propylene oxide etc.). Provide this information.

Response

- a. Compared to fuel oil or coal, natural gas is cleaner burning and metal emissions are not expected. The following three references support this contention.
 - i. Bateman (2005) from the Bay Area Air Quality Management District makes the following comments in a memorandum to his engineering staff: *“AP-42 emission factors for metal emissions are not used because they are based on a small number of tests and have poor EPA data rating”* and *“neither Ventura nor San Diego APCD use metal emission factors”*
 - ii. The Danish National Environmental Research Institute (NERI) provides stationary source heavy metal emission factors for a range of source types. For gas turbines, stationary engines, and combustion sources fired with natural gas, the heavy metal emission factors are reported as 0 mg/GJ. See the attached spreadsheet print-out ([Table 122-1](#)) from NERI (2005).

NERI also states:

“The results of many heavy metal emission measurements have been below the detection limit. The calculation of emission factors is based on the assumption that the emission equals the detection limit in these cases. This has caused an overestimate of some emission factors”.

- iii. The Gas Research Institute (GSI) commissioned a study to determine metal emissions from the combustion of natural gas (Chao et al., 1999). Earlier studies had suggested that potential sources of metal emissions in natural gas fired boilers and turbines might be associated with erosion from pipes and metal surfaces, small deposits from previous oil firing, or the combustion of natural gas. The GSI study concluded that:
 - Natural gas combustion is not a significant source of metal emissions.
 - Metals found in the earlier studies were due to carryover from boilers that had been fired with other fuel (e.g., oil and/or coal).

In conclusion, the evidence indicates that the combustion of natural gas is not associated with metal emissions. Any studies that have suggested otherwise appear to be based on carryover of metals for dual fuel boilers or the application of analytical detection limits.

Note: Highlighted sections are to relevant to the Upgrader.

- b. There are industrial (e.g., the fertilizer plants) and non-industrial (e.g., agricultural operations) sources of ammonia in the region. The Upgrader is not expected to be a source of any appreciable ammonia emissions.

The emission factors for propylene oxide are specific to combustion turbines, and on this basis, propylene oxide emissions have been included in other assessments conducted in the region. As there are no combustion turbines associated with the Upgrader, StatoilHydro does not expect appreciable propylene oxide emissions from the Upgrader.

Upgrader sources of propylene oxide emissions are limited to three reject tanks (Tanks 101, 102 and 103). The total estimated emissions from these three tanks are 0.156 t/y (= 156 kg/y = 0.43 kg/d). The application of the SCREEN3 model indicates a maximum 1-h average propylene oxide concentration of 2.41 $\mu\text{g}/\text{m}^3$. This compares to the 1-h AAAQO of 480 $\mu\text{g}/\text{m}^3$ for propylene oxide.

[Volume 2, Table 2.7-24, Section 2.7.7.2](#) focuses only on the compounds (carbon monoxide, volatile organic compounds, polycyclic aromatic hydrocarbons and total reduced sulphur) for which there are ambient air quality criteria that have not been included in the previous sections of the Application.

123	Volume 2, Section 4.4, Page 4-3
	a. Clarify whether a human health risk assessment was completed for the construction phase. If not, discuss potential health impacts associated with this phase.
	b. Provide evidence to support the discussion.

Response

- a. The human health risk assessment did not include the construction phase. As shown in the response to (b) below, with the exception of acrolein, maximum predicted ground level air concentrations are all less than their applicable ambient air quality objectives and health-based guidelines, suggesting that emissions from the construction phase are not expected to result in adverse health effects.

The 1-h and annual acrolein concentrations associated with the construction phase emissions are both higher than relevant exposure limits. However, the inherent conservatism incorporated into these limits must be given consideration. As outlined in the human health risk assessment (HHRA) ([Volume 2, Section 4](#), Table 4.4-10), the acute acrolein exposure limit is several times lower than the threshold of effects for humans. The chronic acrolein exposure limit is based upon rodent studies due to a lack of chronic human data, and is believed to be overly conservative (see [Volume 2, Section 4.7.1.2](#) of the human health risk assessment (HHRA) for information). Further, the chronic exposure limit is based upon long-term exposure to acrolein. The construction phase of the project is anticipated to be shorter than a person's lifetime (75 years).

- b. The construction phase focussed on fugitive particulate matter (PM) emission estimates associated with construction related land disturbances, that is, clearing and contouring activities. Construction will also include diesel fuelled equipment associated with these and other activities. An indication of the potential human health effects due to exposures to diesel exhausts is provided in the following.

[Table 123-1](#) below provides estimated information regarding construction equipment type and the estimated duration of construction equipment use that were used to calculate the fuel consumption. Estimates for emissions of various substances from equipment used for construction can be obtained from relevant United States Environmental Protection Agency (U.S. EPA) Tier 3 standards for off-road diesel engines, which are in effect from 2006 to 2011 (U.S. EPA, 2004).

This assessment focuses on SO₂, NO_x, CO, PM_{2.5}, benzene, 1,3-butadiene, acetaldehyde and acrolein emission from the diesel use. The PM_{2.5} was regarded as the equivalent of diesel particulate matter (DPM) that for the most part is in the PM_{1.0} size range. [Table 123-2](#) below presents emission rates for these substances based on a load factor of 0.59. Emission rates are

presented as an annual average emission rate for all construction equipment over the maximum construction area (4.39 km²).

The CALPUFF/CALMET dispersion modelling system was used to predict maximum concentrations due to diesel emission sources, and these values are shown in [Table 123-3](#) below. Maximum predicted concentrations for all contaminants are less than the applicable Alberta ambient air quality objectives (AAAQO).

Table 123-1 Predicted Fuel Consumption for Construction Activities

Equipment Type	Estimated Daily Operations (h/d)	Estimated Duration of Operation (months)	Maximum Number of Units	Fuel Type	Engine Size	Fuel Consumption	
					(hp)	(USG/h/unit)	(USG/d)
Cats	16	36	22	Diesel	250	5.0	1,760

124	Volume 2, Section 4.4.1.1, Pages 4-3 to 4-4
	<p>Statoil has not identified an aboriginal receptor as a potential land use group.</p> <p>a. Update the Human Health Risk Assessment (HHRA) to include an aboriginal receptor. Discuss the results.</p>

Response

- a. The focus of the human health risk assessment (HHRA) was on those communities and individuals potentially affected by the project. The Alexander First Nation is located approximately 50 km west of the Project. Considering that the winds are predominately from the northwest, the considerable distance of the Alexander First Nation from the Project location and that the lands adjacent to the project are private lands, the potential exposure of the Alexander First Nation members to the Project emissions is anticipated to be minimal. It is StatoilHydro's view that the Alexander First Nation, or any of the area's other aboriginal groups, will not be directly affected by the Project.

The HHRA evaluated the potential for adverse health effects to occur to individuals who reside or work in the area. These groups are anticipated to have higher overall exposures than those for the aboriginal communities. Evidence of this is provided in [Table 124-1](#) below.

Table 124-1 Comparison of Ingestion Rates for Agricultural Residents Assessed in the HHRA to First Nation Land Users

Parameter	Consumption Rates (g/day)	
	Agricultural Resident (HHRA receptor) ¹	First Nation ²
Root vegetables	188	3
Fruit	46	23
Local beef and game	201	58
Fish	40	47

Notes:

¹Source: Table 4B-2, Section 4B2.5.2, Appendix 4B, Volume 2 of EIA

²Consumption rates taken from Health Canada (1994 and 2004) and adopted from Alberta Health and Wellness

As shown, ingestion rates for the agricultural residents are generally greater than those that would have been used to assess the potential health impacts to First Nation members who may undertake activities in the area. The exception is for the fish ingestion rate, wherein the First Nation rate is slightly higher than the one used for the area residents. The difference in the ingestion rate would not affect the conclusions drawn with respect to the potential health risks associated with the fish ingestion pathway (see [SIR Response 128](#)).

The First Nations ingestion rates were adopted from two Alberta Health and Wellness studies that considered dietary intake rates for health risk assessments of First Nations communities in northern Alberta:

- 2) Alberta Health. 1997. Swan Hills Special Waste Treatment Centre Human Health Impact Assessment. Health Surveillance, Alberta Health. October 1997.
- 3) Alberta Health and Wellness. 2007. Assessment of the Potential Lifetime Cancer Risks Associated with Exposure to Inorganic Arsenic among Indigenous People Living in the Wood Buffalo Region of Alberta. March 2007.

Agricultural residents were assumed to consume all their dietary items from the immediate area, while First Nation members were assumed to collect only a fraction of their diets from the Project area. Because First Nations' members are assumed to experience lower exposure levels than the area's agricultural residents, aboriginal communities are expected to be presented with lower health risks than those described in the HHRA (i.e., for persons residing in the area).

125	<p>Volume 2, Section 4.4.1.2, Page 4-5</p> <p>Listed in Table 4.4-1 are the Chemicals of Potential Concern (COPC) that were evaluated in the HHRA. The full chemical list before the screening and groupings is provided in Appendix 4A. The aliphatic C1-C4 group was not included in the full chemical list.</p>
	<p>a. Discuss whether aliphatic C₁-C₄ could be released from the project. If they are released, discuss how they were addressed in the HHRA.</p>
	<p>b. Were any chemicals included as a result of stakeholder concern or regulatory requirements? If so, identify which ones.</p>

Response

- a. Compounds in the C₁-C₄ aliphatic group are expected to be released from the Upgrader. However, Volume 2B of “Patty’s Industrial Hygiene and Toxicology” states that “the paraffin gases C1 to C4 are practically nontoxic below the lower flammability limit, 18,000 to 50,000 ppm; above this, low to moderate incidental effects such as central nervous system depression and irritation occur, but are completely reversible upon cessation of the exposure ... At higher concentrations and when mixed with air the gases may become anesthetics and subsequently asphyxiants by diluting or decreasing the available oxygen.” (Clayton and Clayton, 1981, page 3176).

Lighter hydrocarbons generally exhibit low intrinsic toxicity. For example, no definite symptoms have been observed in ethane concentrations up to 2.5% (i.e., 25,000 ppm). For these compounds, health effects are not observed until very high concentrations are achieved in air. Unless the atmosphere is deficient of oxygen (i.e., less than 18%) due to their release, no significant physiological effects are expected with exposure to the C₁-C₄ hydrocarbons. The high concentrations necessary to produce asphyxia would not occur as a result of the Upgrader’s emissions.

For these reasons, the C₁-C₄ aliphatics were not included in the human health risk assessment (HHRA).

Reference

Clayton, G.D. and F.E. Clayton (eds). 1981. Patty’s Industrial Hygiene and Toxicology: Volume 2B.

- b. Chemicals of potential health concern raised by stakeholders included sulphur compounds, hydrogen sulphide, sulphur dioxide, nitrogen oxides, benzene and ozone. All but ozone were quantitatively evaluated in the HHRA. Ozone was addressed in Volume 2, Section 2.7.6.

126	<p>Volume 2, Section 4.4.1.3, Page 4-7</p> <p>Statoil states <i>As described in Volume 3, Section 7 – Surface Water Quality, sediment release, dewatering activities and surface runoff from the Project are not expected to measurably change surface water quality in the local study area and ...predicted phenol and metal concentrations downstream from the Project's outfall were either less than or equal to measured concentrations in the NSR or met relevant health-related guidelines and For these reasons, any exposure pathways related to surface water, whether direct (e.g. drinking water) or indirect (e.g., fish consumption), were excluded from the HHRA.</i> The intention of the HHRA is to obtain a reasonably conservative estimate of health effects on receptors in the study area. Exposure to chemicals via the water pathway is a part of the overall exposure profile, and should be included in the HHRA. In addition, the Project will still contribute some contaminants to the waterbodies in the region, and thus the health impacts must be assessed using a quantitative HHRA.</p> <p>a. Provide the required multi-media assessment which includes impacts from the ingestion of water.</p>
-----	--

Response

- a. The following information addresses the potential health risks associated with incidental ingestion of water while swimming in the North Saskatchewan River (NSR). [SIR Response 127](#) and [SIR Response 128](#) provide further assessment of the direct and indirect exposure pathways related to water.

To date, polycyclic aromatic hydrocarbons (PAHs) measured in NSR surface water have been less than the analytical detection limit of 0.01 ug/L. Due to the uncertainty with respect to the amount of PAHs actually present in NSR water and for the fact that the project is not expected to release any PAHs into the NSR, exposure to PAHs via water related pathways could not be determined with confidence. For this reason, the focus of this assessment is on the measured and predicted concentrations of metals documented in the Water Quality section of the Application ([Volume 3, Section 7](#)).

The concentrations of metals in surface water evaluated are summarized in [Table 126-1](#) below. The predicted concentrations 1.29 km downstream represent the existing conditions plus contributions from the Project.

Table 126-1 Summary of Surface Water Concentrations

Metals	Measured Concentration in North Saskatchewan River (mg/L)	Predicted Concentration 1.29 km Downstream (mg/L)
Aluminum	0.073	0.0747
Beryllium	0.0001	0.0001
Cadmium	ND	0.000002
Chromium	ND	0.00001
Copper	0.001	0.001
Cyanide	ND	6.0E-04
Lead	0.0009	0.0009

Metals	Measured Concentration in North Saskatchewan River (mg/L)	Predicted Concentration 1.29 km Downstream (mg/L)
Molybdenum	0.0011	0.0011
Nickel	0.0018	0.0018
Phenol	0.001	0.0012
Vanadium	ND	0.00002
Zinc	0.008	0.0082

ND: not detected.

Based upon the U.S. EPA (2003) swim model, it was conservatively assumed that people could swim in the NSR for up to 5 hours per day. Ingestion rates of 25 mL/h for adult non-competitive swimmers and 50 mL/h for non-competitive child swimmers were also obtained from the U.S. EPA (2003) SWIMMODEL. Body weights were obtained from Health Canada (2004) for each lifestage.

Oral exposure limits were obtained for the metals listed in [Table 126-1](#) below (see [SIR Response 127](#) and [SIR Response 128](#) for additional information). Risk Quotients (RQ) (exposure/exposure limit) were calculated for each of the adult, adolescent, child, toddler and infant lifestages. Given that only one exposure pathway (water ingestion) is being evaluated, an RQ of 0.2 is used as a 'benchmark' of acceptable risk. [Tables 127-2](#) and [127-3](#) below summarize the RQ values calculated.

Table 126-2 Summary of Risk Quotients for Measured/Existing Case

RQ	RQs for Measured/Existing Case				
	Adult	Adolescent	Child	Toddler	Infant
Aluminum	1.3E-04	1.5E-04	5.5E-04	1.1E-03	2.2E-03
Beryllium	8.8E-05	1.0E-04	3.8E-04	7.6E-04	1.5E-03
Cadmium	NA	NA	NA	NA	NA
Chromium	NA	NA	NA	NA	NA
Copper	1.3E-05	1.5E-05	5.4E-05	1.1E-04	2.2E-04
Cyanide	NA	NA	NA	NA	NA

Vanadium	NA	NA	NA	NA	NA
Zinc	4.7E-05	5.6E-05	2.0E-04	4.0E-04	8.1E-04

NA: Not applicable

Table 126-3 Summary of Risk Quotients for Future Predicted Concentrations 1.29 km Downstream of Project Effluent Discharge

RQs for Predicted Concentrations 1.29 km Downstream					
	Adult	Adolescent	Child	Toddler	Infant
Aluminum	1.3E-04	1.6E-04	5.7E-04	1.1E-03	2.3E-03
Beryllium	8.8E-05	1.0E-04	3.8E-04	7.6E-04	1.5E-03
Cadmium	3.5E-06	4.2E-06	1.5E-05	3.0E-05	6.1E-05
Chromium	1.2E-08	1.4E-08	5.1E-08	1.0E-07	2.0E-07
Copper	1.3E-05	1.5E-05	5.4E-05	1.1E-04	2.2E-04
Cyanide	2.1E-05	2.5E-05	9.1E-05	1.8E-04	3.7E-04
Lead	4.5E-04	5.4E-04	2.0E-03	3.9E-03	7.8E-03
Molybdenum	3.9E-04	4.6E-04	1.7E-03	3.3E-03	6.7E-03
Nickel	1.4E-04	1.7E-04	6.2E-04	1.2E-03	2.5E-03
Phenol	7.1E-06	8.4E-06	3.0E-05	6.1E-05	1.2E-04
Vanadium	3.9E-06	4.7E-06	1.7E-05	3.4E-05	6.8E-05
Zinc	4.8E-05	5.7E-05	2.1E-04	4.1E-04	8.3E-04

NA: Not applicable

All RQ values were lower than 0.2 for the surface water ingestion pathway in both the existing (measured) case and the future case where Project effluent is discharged to the NSR. This suggests that the increase in risk above the existing/measured case attributable to the Project is negligible.

127	<p>Volume 2, Section 4.4.1.3, Page 4-7</p> <p>Statoil states that “<i>Although groundwater is a source of drinking water for many residents in the area, groundwater ingestion was excluded from the HHRA due to the apparent absence of COPCs in groundwater (Volume 3, Section 5 and Shell, 2007) and the premise that the Project will not alter groundwater quality.</i>”</p> <p>It seems unreasonable to presume that there is absolutely no exposure to COPCs via groundwater. Groundwater ingestion will contribute to the overall contaminant load for receptors, and thus must be included in the HHRA.</p>
	<p>a. Provide an updated assessment that takes in to account groundwater ingestion.</p>

Response

- a. Potential ingestion of groundwater is addressed in [SIR Response 128](#) below.

128	Volume 2, Section 4.4.1.3, Page 4-7 a. Include the fish consumption pathway in the HHRA. Consider the chemicals that are being released in the effluent from the project into the North Saskatchewan River.
-----	---

Response

- a. The multiple-pathway assessment of the agricultural and residential groups has been updated. The sections below summarize the methodology and data used.

The risk assessment methodology described in the original human health risk assessment (HHRA) applies to this update as well.

Background

The original HHRA evaluated aliphatic and aromatic compounds, including polycyclic aromatic compounds. In addition to the chemicals of potential concern (COPC) originally assessed in the multi-pathway assessment, metals were also included in the update, given the nature of the Project effluent. An assessment of incidental ingestion of water during swimming was conducted separately, and is provided in [SIR Response 126](#).

Metals considered as part of the update include:

- Aluminum
- Antimony
- Arsenic
- Barium
- Beryllium
- Boron
- Cadmium
- Chromium
- Cobalt
- Copper
- Cyanide
- Lead
- Manganese
- Mercury
- Methylmercury
- Molybdenum
- Nickel
- Phenol
- Selenium
- Silver
- Strontium
- Thallium
- Tin
- Uranium
- Vanadium
- Zinc

The aliphatic and aromatic groups, and the polycyclic aromatic hydrocarbons (PAHs) evaluated were the same as in the original HHRA.

Only the agricultural and residential receptors were evaluated, as long-term residency (e.g., a lifetime) and consumption of local foods and water were not relevant to the other groups considered for the HHRA.

Exposure Assessment

The following two pathways of exposure were added to the existing multiple-pathway exposure models from the original HHRA:

- ingestion of groundwater; and
- ingestion of fish from the North Saskatchewan River (NSR).

StatoilHydro conducted groundwater sampling and analysis for PAH compounds subsequent to the submission of the original environmental impact assessment. Analysis for metals was completed in 2007. The groundwater data are summarized in [Table 128-1](#) below.

Table 128-1 Summary of Measured Groundwater Data for the StatoilHydro Upgrader

COPC	Maximum Measured Groundwater Concentration (mg/L)	Groundwater Concentration Assumed for HHRA (mg/L)
PAHs and Non-Metals

Zinc	0.08	0.08

All substances that were below analytical detection limits in groundwater were assumed to be zero in the multiple-exposure pathway model.

Petro-Canada Oil Sands Inc. (PCOSI) (2007) presented measured PAH concentrations in fish caught from the North Saskatchewan River. These data are summarized in [Table 128-2](#). As all measurements were below analytical detection limits, the fish tissue concentration of PAHs were all assumed to be zero.

Table 128-2 Summary of Measured Fish Tissue Concentrations

PAHs	Measured Concentration (mg/kg ww), PCOSI 2007	Assumed Concentration for HHRA (mg/kg ww)

In light of the data that were collected in support of the StatoilHydro application and those that were collected in support of other upgrader applications (e.g., PCOSI 2007; Shell 2007), it is reasonable to conclude that water and fish pathways are not significant sources of PAH exposure to the area residents. Due to the uncertainty with respect to the amount of PAHs actually present in groundwater, surface water and fish and for the fact that the project is not expected to release any PAHs into the NSR, exposure to PAHs via water related pathways could not be determined with confidence. For this reason, the focus of this assessment is on the measured and predicted concentrations of metals in groundwater and surface water from the NSR.

In the supporting documentation for the Canadian Soil Quality Guideline for Carcinogenic PAHs, CCME (2008) states that the general population is primarily exposed to PAHs via consumption of food and as a result of cigarette smoking. CCME suggests typical Canadians could be exposed to 1 ug/day of benzo(a)pyrene, accounting for non-occupational related respiratory, gastrointestinal, and percutaneous absorption. As shown in Table 128-3, this falls within the range of estimated daily intakes to PAHs from food and/or all exposure pathways for North America and Europe. The daily intake of 1 ug/day equates to 0.02 ug/kg bw/day. When compared against the U.S. EPA risk specific (oral) dose of 0.0014 ug/kg bw/day, the estimated daily intake is associated with a lifetime cancer risk level of 14 in 100,000.

Given that PAHs are consistently below their detection limits in soil, vegetation, groundwater and fish, it is not unreasonable to assume that residents of the Fort Saskatchewan area are currently being exposed to levels of PAHs that are comparable to those experienced by Canadians as a whole. Likewise, one can assume that the area residents' "background" lifetime cancer risk for PAHs would be in the order of those predicted for the rest of the Canadian population (i.e., 14 in 100,000 for benzo(a)pyrene).

Table 128-3 Estimated Daily Intakes to PAHs in North America and Europe

Estimated Intakes (ug/day)	Description
<i>North America</i>	
0.026 to 2.6	Estimated average daily intake of individual PAHs in food by Canadians. Individual PAHs evaluated include fluoranthene, benzo(k)fluoranthene, dibenz(a,i)pyrene, 9,10-dimethylbenzanthracene, benz(a)anthracene, benzo(b)fluoranthene and dibenz(a,h)anthracene.
0.061 to 0.10	Estimated average daily intake of dibenz(a,h)anthracene in food by Canadians.
<i>U.S.</i>	
1 to 5	Intake of carcinogenic PAHs for an American adult male based on an average American diet.
6 to 9	Intake of carcinogenic PAHs for an American adult male consuming a diet with large meat content.
3	The median total exposure to carcinogenic PAHs for an American adult male when considering all pathways.
0.05	The U.S. EPA estimated a daily benzo(a)pyrene intake from food.
0.18	The daily median total ingested dose of benzo(a)pyrene based on a urinary biomarker study of 14 adult volunteers in New Jersey over 14 consecutive days.
1.6 to 16	Estimated daily oral PAH intakes (including 30% carcinogenic PAHs) from food <i>per capita</i> in the U.S.
0.16 to 1.6	Estimated daily benzo(a)pyrene intake from food <i>per capita</i> in the U.S.

Estimated Intakes (ug/day)	Description
<i>Europe</i>	
1.1 to 22.5	Estimated daily oral PAH intakes from food <i>per capita</i> in the Netherlands.
0.03 to 0.35	Estimated daily benzo(a)pyrene intake from food <i>per capita</i> in the Netherlands.
5 to 17	Mean daily dietary intake of total PAHs (17 compounds evaluated) for 18 year old males based on a Dutch market-basket survey.
0.12 to 0.29	Estimated daily benzo(a)pyrene intake from European total diets.
0.25, 0.17, 0.03	Estimated daily intake in the U.K. for benzo(a)pyrene, benzo(e)pyrene and dibenz(a,h)anthracene, respectively.

Toxicity Assessment

The process for selecting exposure limits was summarized in [Section 4.4.3](#) of the HHRA ([Volume 2, Section 4](#)).

The new COPCs were evaluated with respect to water and fish ingestion, not inhalation or the terrestrial routes of exposure as these substances are not anticipated to be released to air. The chronic oral exposure limits selected for use in this update are summarized in [Table 128-6](#) below.

Table 128-6 Summary of Chronic Oral Exposure Limits

Manganese and uranium both presented RQ values greater than 1 for the agricultural and residential receptors. As the RQ values are the same across the assessment cases, existing background concentrations appear to contribute the most risk.

All RQ values for the Project alone are less than one, suggesting that the incremental impact of the Project is negligible.

Manganese

Both the agricultural and residential receptors presented RQ values of 1.6. This RQ value is attributable to the groundwater exposure pathway, where the maximum detected concentration of 601 ug/L was assumed as the exposure concentration.

The chronic exposure limit for manganese (RfD 140 ug/kg-day) is based on a No-Observable-Adverse-Effect-Level (NOAEL) of 10 mg/d or 0.14 mg/kg bw/d for a 70 kg adult (U.S. EPA, 2007). The NOAEL was derived from composite data from several studies based on central nervous system (CNS) effects in humans. Health Canada (1987) estimates that the daily dietary intake of manganese is about 3,900 ug/d to 5,600 ug/d, with the greatest source of exposure being through food. Health Canada (1987) states that no adverse effects in humans have been noted in association with manganese intake from foods ranging from 2,000 ug/d to 7,000 ug/d, and that manganese is not considered to be toxic at low to moderate levels of exposure. The recommended daily intake for manganese ranges from 3 ug/d in infants to 11,000 ug/d in adults (Health Canada, 2006).

In this HHRA, the "background" estimated daily intake for toddlers is about 3,600 ug/d, which is within the range associated with no adverse effects in humans (2,000 ug/d to 7,000 ug/d). The Project is not expected to contribute to these risks.

Uranium

Both the agricultural and residential receptors presented RQ values of 2.9 for uranium. This RQ value is primarily associated with the groundwater pathway, where the maximum detected concentration of 47.2 ug/L was assumed as the exposure concentration.

This concentration is higher than the Canadian Drinking Water Quality Guideline of 20 ug/L (Health Canada, 2008). Uranium may be present in water supplies as a result of leaching from natural deposits, tailings, coal and fuel combustion and some fertilizers (Health Canada, 2001). Uranium concentrations up to 700 ug/L have been observed in private groundwater wells in Canada (Health Canada 2001). This guideline is based upon a lowest-observed adverse effect level (LOAEL) of 60 ug/kg-day for kidney lesions, observed in a 91 day study in rats. The estimated daily intake in the HHRA of uranium is estimated to be about 1.7 ug/kg-d, which is approximately 35 times lower than the toxicological

threshold of 60 ug/kg-d. As such, the predicted RQ values of 2.9 may overstate the actual risks associated with background exposure to uranium. The Project is not expected to contribute to these risks.

Carcinogenic Multi-Pathway Results

The Lifetime Cancer Risk (LCR) values for the background, baseline, application and cumulative cases and the Incremental Lifetime Cancer Risks (ILCR) for the Project case are presented in [Table 128-9](#) below. There is no clear regulatory benchmark for LCRs as these values include background exposures. LCRs should be interpreted as cases per 100,000 people. The 'acceptable' level of incremental lifetime cancer risk (ILCR) as designated by Health Canada (2004) is 1 in 100,000. Only the Project case risk estimates should be evaluated as ILCRs.

Table 128-9 Summary of Lifetime Cancer Risks and Incremental Lifetime Cancer Risks for the Agricultural and Residential Receptors

Cancer Risk Levels (unitless)	Agricultural					Residential				
	Background	Baseline	Application	Cumulative	Project ILCR (no background)	Background	Baseline	Application	Cumulative	Project ILCR (no background)
Arsenic (Carcinogenic)	3.3E+01	3.3E+01	3.3E+01	3.3E+01	1.2E-01	3.3E+01	3.3E+01	3.3E+01	3.3E+01	1.2E-01

All ILCR values for the Project were less than 1 in 100,000, indicating that the Project is associated with a negligible degree of incremental cancer risk.

Existing arsenic concentrations in groundwater appear to contribute the most risk to the background, baseline, application and cumulative LCR values. It is worth noting that the lifetime cancer risks are based on a maximum measured arsenic concentration in groundwater of 0.009 mg/L, which is less than the Canadian maximum acceptable concentration for arsenic in drinking water of 0.010 mg/L.

The lifetime cancer risk for arsenic was determined to be about 33 per 100,000. These predicted arsenic LCRs are partially due to the conservative Health Canada exposure limit that was applied (RSD of 0.006 ug/kg bw/d) (Health Canada, 2006b). In comparison, the Canadian average daily arsenic intake for a typical adult is between 0.1 ug/kg bw/d and 0.7 ug/kg bw/d (CEPA, 1993). In the current HHRA, the highest estimated daily intake of arsenic from the background case was 0.32 ug/kg bw/day. This predicted arsenic intake level is within the range for the average Canadian person.

Although it is generally accepted that arsenic can act as a human carcinogen, considerable debate remains surrounding the carcinogenic potency of arsenic, especially at low-dose levels:

- The majority of the evidence supporting an association between exposure to arsenic and elevated cancer rates originates from epidemiological studies of people living in Southeast Asia and South America. In contrast, most studies completed in North America have shown no association between arsenic levels in drinking water and the occurrence of cancer.
- There is mounting evidence that the carcinogenicity of arsenic may represent a high-dose phenomenon only (i.e., consistent with a threshold-type response). Some evidence even suggests that low doses of arsenic may confer a protective effect against the occurrence of cancer (ATSDR, 2005).
- The mechanism by which arsenic causes cancer is not well established. It is currently unclear whether arsenic acts directly via a genetically-mediated mechanism, thereby qualifying arsenic as a 'non-threshold' carcinogen, or through one or more non-genotoxic mechanisms, thereby qualifying arsenic as a 'threshold' carcinogen. The difference in classification could have a considerable bearing on cancer risk estimates.

Cancer risk estimates calculated on the basis of the non-threshold exposure limit may be overestimated, and should be interpreted with caution, and with full understanding of the conservatism incorporated into the predicted risk values.

129	<p>Volume 2, Section 4.4.2.1, Page 4-10</p> <p>Screening for chemicals to include in the multi-media assessment was based on: <i>having a soil half-life greater than or equal to 6 months or 182 days, or an octanol-water partition coefficient (log Kow) greater than or equal to 5.</i> The definitions set out for persistence and bioaccumulation are determined within the <i>Canadian Environmental Protection Act</i> to prioritize substances on the Domestic Substance List (DSL). While this is a useful method to prioritize which compounds need national guidance and regulation it in no way implies that if a substance does not meet these criteria that the chemical should be considered safe and/or non-toxic. As well, even if the half-life is less than 182 days, a person can be exposed to an appreciable amount of COPC. As such, using this screening tool does not seem appropriate for an HHRA.</p> <p>a. Provide evidence that a screening for the multi-media exposure pathway based solely on persistence and bioaccumulation using DSL criteria is adequate for human health and provide evidence that the criteria itself is sufficient to identify COPC for human health.</p> <p>b. Provide a screening for the multi-media exposure assessment which also considers the inherent toxicity of a chemical. Update the human health risk assessment accordingly.</p>
-----	---

Response

- a. The environmental fate and persistence screening conducted as part of the human health risk assessment (HHRA) was only used to identify those substances that may persist or accumulate in the environment. The screening was not used to identify chemicals of potential concern (COPC) for the HHRA.

As requested, a toxic potency screening (which considers the inherent toxicity of the COPC) has been conducted and the results are provided below.

To identify the toxic potency of the COPC, the following steps were taken:

- Determine the maximum predicted annual air concentration for potential emissions associated with the Project at receptor locations relevant to multi-pathway exposure routes (i.e., maximum predicted concentration out of the agricultural and residential locations).
- Identify chronic oral toxicological reference values (TRV) for all chemicals. The most scientifically defensible exposure limits available from Health Canada, the U.S. EPA, Agency for Toxic Substances and Disease Registry and Netherlands National Institute for Public Health and the Environment were used in the screening.
- Calculate the toxic potency of each chemical using the following equation:

$$\text{Toxic Potency} = \frac{\text{Concentration for Project Alone}}{\text{TRV}}$$
- Sort the COPC according to their relative toxic potency.

- Identify those chemicals that make up 99% of the emissions' cumulative toxic potency.

The chemicals that made up 99% of the toxic potency are shaded in [Table 129-1](#) below.

Table 129-1 Oral Toxic Potency Screening

Chemical	Maximum Annual Concentration (ug/m ³)	Oral Exposure Limit (ug/kg-d)	Toxic Potency	Relative Potency
benzene	2.2E-01	3.2E-02	6.8E+00	95.8%
propylene oxide	8.8E-03	4.2E-02	2.1E-01	3.0%
acrolein	1.0E-02	5.0E-01	2.0E-02	0.3%

H ₂ S	1.4E+00	--	0.0E+00	0.0%
hexane	1.5E+00	--	0.0E+00	0.0%
		TOTAL	7.1E+00	100.0%

-- = Not Available

The three substances that comprise 99% of the Project emissions relative toxic potency are benzene, propylene oxide and acrolein. All three compounds were included in the acute and chronic inhalation assessments.

The potential for a substance to bioaccumulate or persist in the environment must also be considered when determining if multiple routes of exposure (other than air) are 'open' pathways of exposure. The available scientific literature suggests that volatile organic compounds (VOCs) and other airborne contaminants are not anticipated to significantly contribute to human exposure *via* consumption of plant-based foods. For example, approximately 99% of human exposure to benzene is through inhalation (ATSDR, 2007). Therefore, the HHRA evaluated non-persistent and non-bioaccumulative VOCs through the inhalation pathway only. Evaluating these compounds in the multi-media exposure model would result in similar risk values to those predicted in the inhalation assessment.

In the oral potency screen in [Table 129-1](#) above, benzene and acrolein comprised 96% of the total toxic potency of the Project emissions. Level I fugacity modeling for VOCs such as benzene, toluene, ethylbenzene and xylene indicates that 99% of these compounds will partition to air (Mackay et al., 1992). As such, acrolein, benzene and formaldehyde were only evaluated with respect to inhalation. Persistence or bioaccumulation of these substances in environmental media is unlikely, and direct air inhalation is the pathway associated with the greatest potential for human exposure.

Thus, the results of the oral toxic potency screening do not require modifications to the original HHRA.

	a. In order to follow the principle of a conservative risk assessment, include acrolein in the acute and chronic mixture for respiratory tract irritants. Assess potential impacts to human health.
	b. Provide a table similar to Table 4.7-2 for the chronic health effects of acrolein. Using the toxicological and epidemiology data discuss potential health impacts as a result of chronic exposures to acrolein both on a project alone and cumulative basis (i.e., include a discussion of the health impacts of the project plus background, not just the project's contribution to background).
	c. Detail the indoor and outdoor acrolein sources and their respective apportions that contribute to Risk Quotients that, in some cases, are greater than 52 (all receptor types, all development scenarios).
	d. Discuss how acrolein concentrations might accumulate in indoor environments.

Response

- a. In the original human health risk assessment (HHRA), acrolein was evaluated as an eye irritant and thus was not included in the respiratory irritants mixture. However, to fulfill this request, acrolein has been evaluated using an exposure limit based on respiratory effects.

The ATSDR (2006) has derived an acute minimum risk level (MRL) of 0.003 ppm (or 0.0069 mg/m³) based on decreased respiratory rate and nose and throat irritation. Forty-six (46) volunteers were exposed to a gradually increasing concentration of acrolein for 40 minutes. Participants subjectively scored irritancy at 5-minute intervals as the concentrations increased from 0 ppm to 0.6 ppm (0 mg/m³ to 1.3 mg/m³) over a 35 minute period. For the final 5 minutes of exposure, participants were exposed to 0.6 ppm. A Lowest Observable Adverse Effect Level (LOAEL) for nose irritation of 0.26 ppm (0.60 mg/m³) was identified. The ATSDR applied an uncertainty factor of 100 to the LOAEL to account for the use of a LOAEL (10-fold) and intra-species variability (10-fold). This acute MRL of 6.9 ug/m³ was used as a 1-h inhalation limit in the assessment of nasal and respiratory tract irritant mixtures.

With the inclusion of acrolein, the acute respiratory irritant group now includes:

- acetaldehyde
- aliphatic alcohols
- aliphatic ketones
- ammonia
- hydrogen sulphide
- nitrogen dioxide
- sulphur dioxide
- xylenes
- acrolein

The original risk estimates for the acute respiratory irritants are presented in [Table 130-1](#) below, while the revised risk estimates for the acute respiratory irritants (which include acrolein) are provided in [Table 130-2](#) below.

Table 130-1 Summary of Original Acute Respiratory Irritant Mixture Risk Quotient Values

Receptor Group	Background	Baseline	Application	Cumulative	Project
Agricultural	7.1E-01	9.0E-01	1.4E+00	1.6E+00	1.2E+00
Residential	5.8E-01	6.4E-01	7.9E-01	1.1E+00	3.7E-01
Industrial	3.0E+00	3.0E+00	3.0E+00	3.1E+00	1.5E+00
Monitoring	1.1E+00	1.4E+00	1.6E+00	1.8E+00	8.9E-01
Public Use Area	7.3E-01	8.4E-01	1.0E+00	1.3E+00	5.1E-01
Fenceline	6.4E-01	7.2E-01	2.8E+00	3.0E+00	2.6E+00

Table 130-2 Summary of Modified Acute Respiratory Irritant Mixture Risk Quotient Values

Receptor Group	Background	Baseline	Application	Cumulative	Project
Agricultural	7.8E-01	9.7E-01	1.5E+00	1.7E+00	1.2E+00
Residential	6.7E-01	7.2E-01	8.5E-01	1.1E+00	3.7E-01
Industrial	3.0E+00	3.0E+00	3.1E+00	3.1E+00	1.6E+00
Monitoring	1.2E+00	1.5E+00	1.6E+00	1.9E+00	9.3E-01
Public Use Area	7.9E-01	9.0E-01	1.1E+00	1.4E+00	5.2E-01
Fenceline	7.1E-01	7.9E-01	2.9E+00	3.1E+00	2.7E+00

Combined risk quotient (RQ) values for the acute respiratory irritants exceeded one for all receptor groups. Project only RQ values exceeded one for the agricultural, industrial and fenceline receptors.

For the agricultural group, the mixture components contributing the most risk are sulphur dioxide (RQ 0.7), hydrogen sulphide (RQ 0.3) and nitrogen dioxide (RQ 0.2 – 0.3). While it is recognized that all three substances may cause respiratory effects, to assume that their effects are additive may be overly conservative. These mixture RQs are similar to those present in the original HHRA.

For the residential group, the mixture RQ of 1.1 was slightly above one in the Cumulative case only, and is similar to the original mixture RQ. Mixture components associated with the most risk at the residential locations included sulphur dioxide (RQ 0.7) and nitrogen dioxide (RQ 0.3).

The acute respiratory mixture for the industrial receptor is associated with an RQ of 3.0 in the baseline case, increasing to 3.1 in the application and cumulative cases. The background mixture RQ value is approximately 3 as well, indicating that the existing emission sources contribute the most to all assessment cases. The maximum Project respiratory mixture RQ of 1.6 for this group occurs at a different industrial location than the one presenting the maximum Background, Baseline and Application case air concentrations. Of the mixture constituents, sulphur dioxide (RQ 2.4) and nitrogen dioxide (RQ 0.4) appear to contribute the most risk.

For the public use area group under the cumulative case, the respiratory irritants mixture is associated with an RQ value of 1.4. Sulphur dioxide (RQ 0.7), nitrogen

dioxide (RQ 0.3) and hydrogen sulphide (RQ 0.13) contribute the most risk at this location. This mixture RQ is similar to the original assessment.

The acute respiratory irritants mixture for the monitoring receptor is associated with an RQ of 1.5 in the Baseline and Application cases, increasing to 1.9 in the Cumulative case. The mixture RQ associated with the Project alone was determined to be about 0.9. As the background RQ is 1.2 and the Baseline RQ is 1.5, existing ambient sources of the mixture components appear to contribute the most risk to Baseline. Of the mixture components, sulphur dioxide contributes the most risk to the Baseline RQ (RQ of 1) with some risk being attributable to nitrogen dioxide and hydrogen sulphide.

The fence line receptor represents a transient individual (not a resident) who may be exposed to a predicted ground level concentration along the Project fence line. Several different fence line locations were evaluated, and it was assumed that these 'peak' concentrations of the respiratory irritants occurred at the same location. The inclusion of acrolein in the respiratory mixture slightly increased the RQ values (by 0.1) in the Project, Application and Cumulative cases. Emissions of SO₂ and NO₂ from existing sources and the Project appear to be associated with the most risk.

Overall, the primary contributors to the predicted risks for the respiratory irritant mixture are nitrogen dioxide and sulphur dioxide. However, the effect endpoints and the modes of action for each of these irritants differ. Nitrogen dioxide can be inhaled deeply into the lungs, acting as a deep-lung irritant, whereas sulphur dioxide is more soluble in water and is readily absorbed through the upper respiratory tract, inducing increases in airway resistance higher up in the respiratory tract (Calabrese, 1991). The dose-response relationships for these chemicals are somewhat independent in that the primary responses occur in different regions of the respiratory tract. For this reason, summing the RQ values for the constituents of the respiratory tract irritant mixture should be considered a conservative assumption.

Furthermore, it was conservatively assumed that the maximum predicted hourly air concentrations for each of the respiratory irritants would occur at precisely the same time for each location assessed in the receptor groups.

For these reasons, the health risks for the respiratory irritants are anticipated to be overestimates of actual respiratory health risks in the region.

The toxicological basis of the chronic exposure limits available for acrolein is on the incidence of nasal lesions (see [Volume 2, Appendix 4A](#)). The HHRA separated eye, nasal and respiratory irritants on the basis that adverse effects on each of these systems likely are related to different mechanisms of effect, and as such, their effects are likely not additive in nature. Exposure limits based upon effects on the lower respiratory tract are not available from the limits evaluated in [Volume 2, Appendix 4A](#). As such, the chronic respiratory mixture has not been updated to include acrolein, due to the lack of an appropriate exposure limit with which to complete this calculation.

- b. The toxicological literature regarding the long-term effects of acrolein in humans is limited, and no information is available regarding adverse effects in relation to exposure levels (U.S. EPA, 2003; WHO, 2002; Government of Canada, 2000; WHO IPCS, 1991). Thus, a table similar to [Table 4.7-2](#) (acute acrolein assessment) cannot be formulated due to a lack of information in the scientific literature.

For the various receptor groups, the chronic RQ values for acrolein in the baseline, application and cumulative cases were the same as the background RQ values. Thus, existing sources drive the risk estimates in all other development cases. [Volume 2, Section 4.7](#) of the HHRA presented discussions associated with the uncertainty associated with the chronic exposure limit and indoor air concentrations of acrolein. Given that the background case contributes the most risk to all other development cases, the discussion provided is relevant to each of the cases where background was added (baseline, application and cumulative). Further, additional discussion of background acrolein exposures was provided in [Volume 2, Appendix 4D](#) of the HHRA ([Volume 2, Appendix 4D](#), page 4-39).

- c. Acrolein emissions for the assessment were based on the emissions factors given in [Volume 2, Appendix 2A, Table 2A-18](#) for Heaters/Boilers/Steam Generators and for flare stacks. The following compares the acrolein emissions from these Project sources:

- Project non-combustion (boilers/furnaces) sources: 0.256 t/y
- Project TGTU/SRU sources: 0.038 t/y
- Project flare (normal operation): 0.010 t/y
- Combined Project Sources: 0.30 t/y

In addition, 0.33% of the traffic VOC emissions (VOC = 69.5 t/d) were assumed to be acrolein ([Volume 2, Appendix 2A, Table 2A-90](#)). Therefore the daily and annual traffic acrolein emissions are 0.227 t/d and 82.8 t/y, respectively. The Project acrolein emissions are a factor of 276 less than the acrolein emissions from traffic. A casual review of emissions inventory information indicates that acrolein emissions do not appear to be well documented. On this basis, the acrolein emissions due to Edmonton traffic are likely overstated given that acrolein emissions from Ontario traffic sources are reported as 194 t/y.

- d. The indoor acrolein concentration used in the HHRA for the agricultural, residential and industrial receptors of 1.3 ug/m^3 was obtained from Gilbert et al., 2005, and is based upon measurements taken from 59 homes. Acrolein concentrations have been observed to range from 0.05 ug/m^3 to 29 ug/m^3 in indoor environments (ATSDR, 2007). Potential sources of acrolein in indoor air include: cigarette or tobacco smoke (main and sidestream smoke), pyrolysis by-products from animal and vegetable fats, polyethylene and polyvinyl materials. Indoor air concentrations may be 2 to 20 times as high as outdoor air concentrations, especially in environment affected by tobacco smoke (U.S. EPA, 2003).

In the HHRA, indoor and outdoor RQ values were calculated separately for background, and then combined into one chronic background RQ value. This total background RQ value was then added to the baseline, application and cumulative cases, and these 'combined' values represent what was presented in [Volume 2, Section 4.7](#). Indoor air concentrations were not re-calculated for the Baseline, Application and Cumulative cases – all indoor air concentrations represent Background.

As requested, the RQ values for chronic indoor and outdoor acrolein are presented in [Table 130-3](#) below.

Table 130-3 Comparison of Background Indoor and Outdoor Chronic Acrolein Risk Quotients for the Six Receptor Groups

Group	Background Indoor Air RQ	Background Outdoor Air RQ	Combined Indoor and Outdoor Air Background RQ	Ratio of Indoor Air to Outdoor Air RQs
Agricultural	5.1E+01	2.2E-01	5.2E+01	2.3E+02
Residential	6.1E+01	7.0E-02	6.1E+01	8.7E+02
Industrial	4.3E+01	3.1E-01	4.4E+01	1.4E+02
Public Use Area	NA	2.1E+00	2.1E+00	NA
Monitoring	NA	3.8E+00	3.8E+00	NA
Fenceline	NA	NA	NA	NA

NA – not applicable to receptor type.

The RQ values for indoor air were about 140 to 870 times higher than the RQ values for outdoor air in the agricultural, residential and industrial groups. All of the RQ values for outdoor air in these three groups were less than one. Thus, it is reasonable to state the assumptions made with respect to indoor air are associated with the most risk. As such, changes in outdoor air concentrations are likely to have a minimal impact on the overall potential total exposures.

For the public use areas and the monitoring stations, existing outdoor sources were associated with the background RQ values of 2.1 and 3.8. As presented in [Volume 2, Section 4.7](#), the RQ values for the Baseline, Application and Cumulative Cases for these two receptor groups were similar to background, indicating that risks are primarily attributable to existing sources.

There is a lack of sufficient data to predict the fate of indoor acrolein (ATSDR, 2007). In outdoor air, the half life of acrolein is relatively short at approximately 15-20 hours (ATSDR, 2007). Available information regarding sources of exposure indicate that tobacco smoke and combustion sources are significant contributors to indoor air, and that it is common for indoor air concentrations to be higher than outdoor air concentrations.

131	Volume 2, Section 4.7, Pages 4-35 to 4-77 Statoil lists in Tables 4.7-2, 4.7-10, 4.7-16, 4.7-21 formaldehyde and the nasal tumours Lifetime Cancer Risks (LCRs) of 12 - 48 for various receptors.
	a. Detail the indoor and outdoor formaldehyde, nasal tumour sources and their respective apportions that contribute to LCRs that, in some cases, are greater than 48 (all receptor types, all development scenarios).
	b. Discuss indoor and outdoor LCRs exposures to formaldehyde and nasal tumour sources for typical Canadians.
	c. Discuss how formaldehyde and nasal tumour source concentrations might accumulate in indoor environments.
	d. Characterize the health impacts of exposure to formaldehyde and the chemicals that comprise the nasal tumour group.

Response

- a. Typically, indoor air concentrations of formaldehyde have been observed to be higher than outdoor air concentrations in Canadian and international studies (CEPA, 2001). Environmental tobacco smoke contributes to indoor formaldehyde exposures, but may not be the primary source of indoor exposures (CEPA, 2001).

Indoor sources of formaldehyde include: pressed wood products, fabrics, fibreglass, laminates, paper products, paints, cosmetics, indoor combustion sources (e.g., stoves, heaters, degradation of other volatile organic products [ATSDR, 1999]).

Ambient sources of formaldehyde are both natural and anthropogenic. Natural sources include combustion of biological materials, irradiation of humic substances by sunlight. Anthropogenic sources include: fuel combustion, industrial releases, building materials, consumer products, and secondary formation from the degradation of other volatile organic compounds (CEPA, 2001; ATSDR, 1999).

Table 131-1 provides a summary of ambient formaldehyde concentrations measured in Canada and the United States, along with their associated lifetime cancer risks (LCR).

Table 131-1 Summary of Ambient Formaldehyde Concentrations in Canada and the U.S.

Location	Air Concentration (ug/m ³)	Description	Reference	Background LCR (RsC=0.77 ug/m ³)
Canada				
Montréal, QC [two sites]; Ottawa, ON; Windsor, ON [two sites]; Toronto, ON; Winnipeg, MB; Vancouver, B.C.	<0.05 (MDL) to 27.5	Range of 24-hour samples from 8 urban areas surveyed from 1989 to 1998, n= 3810 (Total)	CEPA 2001	0.06 to 36
Saint John, NB; Montréal, QC	<0.05 (MDL) to 12.03	Range of 24-hour samples from 2 suburban areas surveyed from 1989 to 1998, n= 3810 (Total)	CEPA 2001	0.06 to 16

Location	Air Concentration (ug/m ³)	Description	Reference	Background LCR (RsC=0.77 ug/m ³)
L'Assomption, QC; Simcoe, ON	<0.05 (MDL) to 9.11	Range of 24-hour samples from 2 rural areas surveyed from 1989 to 1998, n= 3810 (Total), considered to be affected by urban and/or industrial influences	CEPA 2001; WHO 2000	0.06 to 12
Kejimikujik Park, NS; Mount Sutton, QC; St. Anicet, QC; Egbert, ON	<0.05 (MDL) to 9.88	Range of 24-hour samples from 4 rural areas surveyed from 1989 to 1998, n= 3810 (Total), considered to be regionally representative	CEPA 2001	0.06 to 13
Montréal, QC [two sites]; Ottawa, ON; Windsor, ON [two sites]; Toronto, ON; Winnipeg, MB; Vancouver, BC	0.78 to 8.76	Long-term (1 month to 1 year) mean concentrations	CEPA 2001	1.0 to 11
Toronto, ON	22.15	Mean concentration for six 24-hour measurements made at this site during the 30-day period from July 14 to August 12, 1995	CEPA 2001	29
Prince Rupert, BC	0.08 to 14.7	Measured in 96 air samples (12- to 25-hour) collected from roofs of buildings at four sites in urban, residential and industrial areas of Prince Rupert, B.C., during 1994 and 1995	CEPA 2001	0.10 to 19
Not specified	3.01	Maximum 24-hour average concentrations for March-June 1995, near a forest product plant	CEPA 2001	4
Not specified	1.71	Maximum 24-hour average concentrations for July-September 1995, near a forest product plant	CEPA 2001	2.2
Not specified	4.4	Maximum 24-hour average concentrations for October 1995 - March 1996, near a forest product plant	CEPA 2001	5.7
United States				
California, US	3.6	Mean concentration, ARB, average of 1998 and 1999 state-wide ambient means, Maximum 14.3	OEHHA 2001	4.7
All States	0.99 to 9.91	Annual summary, Average of 273 data points (Absolute Min = 0, Max = 205)	U.S. EPA 2007	1.3 to 13
All States	1.06 to 15	Annual summary, Average of 165 data points (Absolute Min = 0.1, Max = 1040)	U.S. EPA 2007	1.4 to 19
Not specified	1 to 20	Annual average estimate, short term peaks (i.e., heavy traffic) can range to 100 ug/m ³	WHO 2000	1.3 to 26

Lifetime cancer risks for background formaldehyde exposure were calculated and included in the human health risk assessment (HHRA) for the Baseline, Application and Cumulative assessment cases.

In the HHRA, indoor and outdoor LCR values were calculated separately for background, and then combined into one chronic background LCR value. This total background LCR value was then added to the Baseline, Application and Cumulative

cases. These “combined” values were presented in the HHRA ([Volume 2, Section 4.7](#)).

As requested, the LCR values for chronic indoor and outdoor formaldehyde are presented in [Table 131-2](#).

Table 131-2 Comparison of Background Indoor and Outdoor Chronic Formaldehyde Lifetime Cancer Risks (LCR) for the Six Receptor Groups

Group	Background Indoor Air RQ	Background Outdoor Air RQ	Combined Indoor and Outdoor Air Background RQ	Ratio of Indoor Air to Outdoor Air RQs
Agricultural	37	2.4	39	16
Residential	44	0.72	45	61
Industrial	31	3.8	35	8.2
Public Use Area	NA	12	12	NA
Monitoring	NA	12	12	NA
Fenceline	37	2.4	39	16

NA – not applicable to receptor type.
 All values are per 100,000.

The LCR values for indoor air were about 8 to 61 times higher than the LCR values for outdoor air in the agricultural, residential and industrial groups. As discussed in the original HHRA, there is no clear benchmark of “negligible” cancer risk for exposures that include background. Thus, it is reasonable to state the assumptions made with respect to indoor air are associated with the most risk. As such, changes in outdoor air concentrations are likely to have a minimal impact on the overall potential total exposures.

As presented in [Volume 2, Section 4.7](#), the LCR values for the baseline, application and cumulative cases appear to be driven by existing background sources of formaldehyde.

- b. The background indoor air concentration used in the HHRA for formaldehyde was obtained from a Government of Canada document, and represents the mean of pooled data from five Canadian studies (151 samples) (CEPA, 2001). The amount of time spent indoors and outdoors for average Canadians was obtained from Health Canada (2004a) and used in the assessment of the residential receptors (who are most likely to be similar to residents in other areas of Canada). As most of the background risk observed is attributable to indoor air, it is reasonable to state the background LCR values presented for the residential receptors adequately represent risks for average Canadians.
- c. Typically, air concentrations of formaldehyde are higher inside residences than in outdoor air (ATSDR, 1999). Building materials, fabrics and carpets, consumer products and household chemicals, indoor combustion sources including smoking, and the degradation of other indoor volatile organic compounds (VOCs) (ATSDR, 1999) all represent potential continuous sources that would contribute to indoor

formaldehyde concentrations. Information regarding the half-life of formaldehyde in indoor air appears to be limited (ATSDR, 1999). It is possible that this is due to the nature of the sources of formaldehyde within indoor environments and the continuous nature of many of the sources (building structure materials, textiles, furniture, and the potential for secondary formation).

- d. The components of the nasal carcinogen mixture included: acetaldehyde, formaldehyde and propylene oxide. The incremental lifetime cancer risks associated with the combined exposure to these compounds were all less than 1 in 100,000.

The RsC of 17.2 ug/m³ for acetaldehyde was developed from a tumorigenic concentration (TC₀₅) of 86 mg/m³, which was associated with a 5% increase in nasal adenocarcinomas and squamous cell carcinomas (combined) in the most sensitive sex (males) of Wistar rats exposed for up to 28 months (Health Canada, 2004b; CEPA, 2001). The TC₀₅ was derived by Health Canada using a multistage model, with adjustment for intermittent to continuous exposure (6 hours/24 hours x 5 days/7 days).

The U.S. EPA derived a unit risk estimate (URE) of 1.3 x 10⁻⁵ (ug/m³)⁻¹ for formaldehyde based upon the incidence of squamous cell carcinoma in rats (U.S. EPA 2007), although this limit is under re-evaluation. As discussed in [Volume 2, Appendix 4A](#), there is some controversy over whether carcinogenic effects are the most sensitive and relevant endpoint to humans. A recent review by Health Canada (2005) established an 8 h indoor air quality objective of 50 ug/m³ for formaldehyde. This is based on respiratory effects but is also considered protective of carcinogenic effects (Health Canada, 2005). In addition, the World Health Organization (WHO) has established a 30 minute criteria of 100 ug/m³ based upon respiratory irritation (although the limit also is noted to be protective of upper respiratory tract cancers) (WHO, 2000).

Both carcinogenic and non-carcinogenic exposure limits were available from the U.S. EPA for propylene oxide. The IARC (1994) classifies propylene oxide as being possibly carcinogenic to humans (Group 2B) based on sufficient evidence in experimental animals. The U.S. EPA chronic RsC of 3 ug/m³ based on nasal cavity hemangioma or hemangiosarcoma in male mice was selected for use in the chronic assessment (U.S. EPA 2007). The RsC was derived from an inhalation unit risk of 3.7 x 10⁻⁶ per ug/m³ and is associated with a risk level of one in 100,000.

When the above chronic RsC values are examined, the following points are evident:

- formaldehyde may or may not be a true nasal carcinogen; and
- the tumour types between the three substances are not exactly the same. Thus, the mechanism of carcinogenicity may be different. The carcinogenic effects may not be truly additive.

As discussed in the original HHRA, existing sources of acetaldehyde and formaldehyde contribute the most 'risk' to the development cases. The chronic nasal tumours mixture presented LCR values greater than 1 in 100,000 for all five receptor types (not including fenceline). The LCR values for receptors that were assumed to

be exposed to indoor air (agricultural, residential, and industrial) are much higher than the receptors breathing outdoor air. Thus, existing ambient sources of nasal carcinogens in both indoor and outdoor air contribute to background exposures, and the background tumour incidence rate. The LCR values ranged from 36 to 46 in 100,000 for the receptors that were assumed to be exposed to both indoor and outdoor air. Formaldehyde is the mixture component associated with the most risk for all receptors, with some contribution from acetaldehyde. The LCR associated with indoor formaldehyde levels ranged from 31 to 44 in 100,000, thus the indoor air formaldehyde concentration used in this assessment is associated with the greatest risk.

Existing ambient outdoor sources of formaldehyde and acetaldehyde also contributed to the mixture LCR values. Both the public use area and monitoring receptors are assumed to be exposed to outdoor air only and presented LCR values of 12 to 13 in 100,000.

132	<p>Volume 2, Section 4, Tables 4.7-1, 4.7-3, 4.7-4, 4.7-8, 4.7-9, 4.7-10, 4.7-13, 4.7-15, 4.7-16, 4.7-19, 4.7-20, 4.7-22, 4.7-24, 4.7-26 to 4-7.31, Pages 4-36 to 4-63</p> <p>Findings of the human health risk assessment indicate that many of the chemicals or chemical mixtures assessed exceed a Risk Quotient (RQ) value of one for various receptors evaluated.</p> <p>a. Discuss future monitoring for these types of hazardous air pollutants.</p>
-----	--

Response

- a. RQ values in excess of one are associated with acrolein (acute and chronic), formaldehyde (acute), PM_{2.5} (acute), and SO₂ (acute). In addition, odour ratios (OR) in excess of one are associated with H₂S. Exceeding an RQ of one does not necessarily trigger the need for monitoring.

As indicated in [Volume 2, Sections 2.8.1.1 and 2.8.1.2](#), StatoilHydro plans to monitor SO₂, TRS and NO_x emissions from the larger stack sources. Also as indicated in [Section 2.8.1.3](#), StatoilHydro proposes to measure trace VOC and PAH concentrations from representative stacks to confirm the emissions and associated rates from the operation of the Upgrader.

StatoilHydro expects to be required to install an ambient air quality monitoring station as part of the environmental operating approval from Alberta Environment. While StatoilHydro plans to work with other stakeholders (including Alberta Environment) through the Fort Air Partnership with respect to siting a station and determining the substances to be measured, StatoilHydro recognizes a need for a station near the community of Bruderheim (specifically on the west edge of the community).

As indicated in [Volume 2, Section 2.8.2](#), the Bruderheim station instrumentation could include SO₂, H₂S, NO₂, O₃, PM_{2.5} and NMHC analyzers. At this stage StatoilHydro does not plan to measure ambient acrolein, or formaldehyde concentrations on a routine basis. The NMHC analyzer would be used as a surrogate to determine the frequency and magnitude of hydrocarbon concentrations.

133	<p>Volume 2, 4.7.1.3, Page 4-41</p> <p>Table 4.4-2 outlines the relevant exposure pathways for the receptor groups. There is a number of exposure pathways listed for the agricultural receptor.</p> <p>a. Clarify why Table 4.7-6 presents only dermal contact and ingestion.</p>
-----	---

Response

- a. All multiple-pathway result tables are presented for dermal contact and ingestion (including [Volume 2, Section 4.7.1.3, Table 4.7-6](#)), because inhalation exposures were assessed separately within the acute and chronic inhalation assessments. 'Ingestion' exposures included direct oral exposure pathways, as well as dust exposures. Given that inhaled dusts are likely to be caught in the mucous membranes of the upper airways and then subsequently swallowed, it is more appropriate to evaluate the dust pathway via an ingestion model. All relevant exposure pathways identified in [Volume 2, Section 4.4.1.3, Table 4.4-2](#) were evaluated for each receptor.

134	<p>Volume 2, Section 4.7.3.1, Page 4-47</p> <p>Statoil states <i>As shown in Table 4.7-11, the differences in the acute risks between the Background, Baseline and Application cases are generally negligible, suggesting that the Project's sulphur dioxide emissions will not add appreciably to acute health risks to the industrial receptor group.</i> While the Project may not change the overall risk quotient, it is still a contributor to the overall COPC concentration.</p> <p>a. Discuss potential health impacts as related to total exposure, not just project alone for all COPCs, and all development scenarios (including background).</p> <p>b. Provide the frequency of exceedances for acute exposures that have RQ >1. Discuss the results.</p>
-----	--

Response

- a. In addition to the interpretation of potential health risks presented in [Volume 2, Section 4](#), a detailed discussion on the health risks associated with total exposures can be found in [Volume 2, Appendix 4D](#). In many instances, existing sources of chemicals of potential concern (COPCs) were the primary contributors to overall exposure. As such, discussion of background risks is relevant to all development cases.
- b. COPC associated with acute RQ values greater than 1 included acrolein, formaldehyde, PM_{2.5} and SO₂ (1-h and 24-h). PM_{2.5} was evaluated in detail using a SUM15 approach in the original application. Additional information regarding acrolein, formaldehyde, and SO₂ is provided in this response.

Acrolein

Exceedance of the 1-h exposure limit of 0.29 ug/m³ were observed at several receptor locations. The locations at which the maximum RQ for each receptor group was observed (e.g., agricultural, residential, industrial, monitoring, public use area, fenceline) in either the Project or Cumulative cases have been evaluated using time-series data.

In the Baseline, Application and Cumulative cases, for the agricultural, residential, industrial, monitoring and public use area groups, the probability of exceeding the exposure limit is less than 5%, as over 95% of the time series data for the receptor locations is below the limit.

For the fenceline group in the Application and Cumulative cases, the probability of exceeding the exposure limit is less than 10%, as over 90% of the time series data is below the limit.

Formaldehyde

RQ values greater than 1 were observed for the agricultural and monitoring groups, and only in the Cumulative case. For both of these groups, the probability that 1-h cumulative formaldehyde concentrations would exceed the exposure limit is less than 5%.

SO₂

1-h exceedances for SO₂ were observed for the industrial and monitoring groups in the Baseline, Application and Cumulative cases. Analysis of time series data reveals that the probability of exceeding the 1-h limit of 450 ug/m³ for SO₂ is less than 5% for both the industrial and monitoring groups in all assessment cases.

Exceedances for 24-h SO₂ were observed for the fence line group of receptors in both the application and cumulative cases. Evaluation of the time series data for this receptor group indicates that over 95% of the 24-h data is below the exposure limit of 150 ug/m³ and that the probability of an exceedance is less than 5%.

135	<p>Volume 2, Section 4.7.3.1, Page 4-49</p> <p>Statoil states <i>When compared against occupational limits and in light of the information presented in AHW's recent reviews, the predicted short-term SO₂ concentrations are not expected to result in adverse health effects to the industrial receptor group.</i></p> <p>a. While this conclusion is understood, discuss any mitigation measures or contingency plans Statoil has or will consider should human health effects actually occur.</p> <p>b. Discuss mitigation plans for other COPCs that show RQ >1.</p>
-----	--

Response

- a. Although the predicted short-term SO₂ concentrations are not expected to result in adverse health effects to the industrial receptor group, StatoilHydro will work with industrial neighbours in the unlikely event of their occurrence. StatoilHydro's sulphur recovery facilities will meet best available technology economically achievable (BATEA) standards.
- b. According to the results of the human health risk assessment (HHRA), chemicals of potential concern (COPCs) (other than SO₂) with risk quotients (RQs) greater than 1.0 include:
- Acrolein on an acute basis (all assessment cases)
 - Acrolein on a chronic basis (all assessment cases other than Project)
 - Formaldehyde on an acute basis (cumulative case only)
 - PM_{2.5} on an acute basis (all assessment cases other than Project)
 - Eye irritants on an acute basis (all assessment cases)
 - Nasal irritants on an acute basis (Cumulative case only)
 - Respiratory irritants on an acute basis (all assessment cases)
 - Nasal irritants on a chronic basis (all assessment cases)

Discussion regarding possible mitigation plans for the irritant groups focuses on those compounds that are primarily responsible for the risk. For example, the respiratory irritant risks are driven by NO₂ and SO₂, suggesting that any mitigation with respect to the respiratory irritation should emphasize those two compounds. The compounds primarily responsible for the eye irritant risks and nasal irritant risks are acrolein and formaldehyde.

Mitigation for SO₂ and NO₂ (and respiratory irritants)

As presented in [Volume 2, Section 2.6](#), StatoilHydro plans to implement a number of measures to control emissions of NO₂ and SO₂:

- The sulphur recovery units (SRUs) for the Project are designed for a sulphur recovery efficiency of 99.9% with an expected annual average recovery of 99.8%.

- The furnaces and combustion turbine units will be designed to be more stringent than the Canadian Council of Ministers of the Environment (CCME) guidelines for NO_x and CO emissions. That is, low-NO_x burners will be used to reduce flue gas NO_x emissions, and, where technically feasible, the Project will use ultra-low NO_x burners.

Mitigation for PM_{2.5}

The StatoilHydro Upgrader will be fired with a gaseous fuel, which is cleaner burning with respect to PM_{2.5} emissions relative to liquid or solid fuels. As well, secondary PM_{2.5} formation will be minimized through the implementation of the high efficiency sulphur recovery and the use of low-NO_x burners.

Mitigation for acrolein and formaldehyde

Project emissions of acrolein and formaldehyde are expected to be minimal when compared to other industrial and non-industrial sources in the region. There are no specific mitigation measures planned to control the emissions of these compounds.

Acrolein and formaldehyde emissions for the assessment were based on the emissions factors given in [Volume 2, Appendix 2A, Table 2A-18](#) for Heaters/Boilers/Steam Generators and for flare stacks. [Table 135-1](#) below summarizes the operational acrolein and formaldehyde emissions for the Project.

Table 135-1 Project Acrolein and Formaldehyde Emissions

Source	Emission rate (t/y)	
	Acrolein	Formaldehyde
Non-combustion (boilers/furnaces)	0.256	7.752
TGTU/SRU	0.038	1.156
Flare (normal operation)	0.010	7.220
Combined Project	0.30	16.128

As shown in [Volume 2, Appendix 2A, Table 2A-90](#), 0.33% and 3.08% of the traffic volatile organic compounds (VOC) emissions (VOC = 25,000 t/y, approximately) were assumed to be acrolein and formaldehyde, respectively. Therefore the annual traffic acrolein and formaldehyde emissions are 82.8 t/y and 770 t/y, respectively. The project acrolein and formaldehyde emissions are a factor of 276 and 48 less than the acrolein and formaldehyde emissions from traffic. This suggests that a reduction in the Project's acrolein and formaldehyde emissions is expected to have minimal influence over the regional emissions and their associated ground level air concentrations.

136	<p>Volume 2, Section 4.7.7.10, Page 4-69</p> <p>With respect to chemical mixtures and chronic leukemia risk, Statoil states that “<i>The mixture risk estimates for the residential receptor were unchanged across the Baseline, Application, and Cumulative cases, with the mixture component contributing the most risk being background benzene exposures.</i>”</p> <p>a. Discuss Statoil’s involvement in regional initiatives aimed at identifying sources, providing mitigation measures to minimize this potential health risk, and better understanding the actual health burden associated with exposure.</p>
-----	---

Response

- a. StatoilHydro has not been involved in any regional initiatives aimed at identifying sources, providing mitigation measures, or better understanding actual health burdens associated with these exposures. StatoilHydro would be interested in participating in such an initiative if one were to be proposed. Involvement in such an initiative would be through StatoilHydro’s membership in the Northeast Capital Industrial Association and the Fort Air Partnership.

137	<p>Volume 2, Section 4.7.8, Page 4-70</p> <p>Statoil states <i>The implementation of the planned mitigative measures for air quality, surface water quality and groundwater quality should ensure that the Project's chemical emissions will not adversely affect human health in the area.</i></p> <p>a. Discuss whether there is any available literature or evidence from other facilities to support this conclusion.</p>
-----	--

Response

- a. As part on the HHRA, a literature review was conducted. Regional studies have been conducted on both health and air and water quality. These studies have been completed by Alberta Cancer Board, Alberta Environment, Alberta Health and Wellness, Capital Health region, Fort Air Partnership, EPCOR, Petro-Canada Oil Sands Inc., Shell Canada, and Synenco Energy Inc. These studies are discussed in [Volume 2, Section 4](#) of the StatoilHydro environmental impact assessment.

138	Volume 2, Section 4.8, Tables 4.8-1 to 4.8-3, Pages 4-71 to 4-73
	Odour concentration ratios exceed 1.0 for H ₂ S in all receptor scenarios.
	a. What are the predicted effects associated with these exceedances?
	b. Outline Statoil's response plan should odor complaints or exceedances of odor guidelines occur.
	c. Discuss future monitoring of odorant chemicals and other response actions.
	d. Provide an updated odour assessment that evaluates the impact of odours associated with the four upset scenarios.

Response

- a. The odour threshold for H₂S (14 ug/m³) is approximately 200 times lower than the effect-threshold for adverse acute effects (lowest observable adverse effect level of 2 ppm or 2,800 ug/m³) noted by ATSDR (2006). The 1-h exposure limit for H₂S is 98 ug/m³, which is seven times higher than the odour threshold. An odour ratio that exceeds 1.0 signifies that a person may be able to detect an odour in association with H₂S. However, given the magnitude of difference between the level at which odours are detected and the level at which health effects may occur, it is unlikely that air concentrations slightly above the odour threshold (i.e., odour ratio >1) would result in measurable health effects.
- b. Although a site specific procedure has yet to be developed, StatoilHydro will have trained personnel on-site to assist with determining the cause of and resolving such exceedances. The odour response plan will include the following elements:
1. Record time, and location of complaint.
 2. Retrieve ambient air quality and wind data from all Fort Air Partnership stations.
 3. Conduct a site fence-line survey to determine if the odour is as a result of StatoilHydro operation. In parallel, have operation personnel determine if any upset conditions have occurred.
 4. If it is determined StatoilHydro is the source of the odours, determine the cause and rectify. Report to the appropriate regulator if required. If warranted, conduct an off-site visit to the complainant.
 5. Record and report data for internal and external reporting requirements.
- c. As stated in [Volume 2, Section 4.9](#), StatoilHydro will undertake the following monitoring:
- source monitoring of sulphur dioxide and reduced sulphur compounds;
 - source monitoring of nitrogen oxides;
 - implementation of a leak detection and repair (LDAR) program; and
 - participation in the Fort Air Partnership ongoing ambient air monitoring program.

In addition, StatoilHydro will install hydrogen sulphide and hydrocarbon detectors at specific, higher risk locations at the facility. StatoilHydro will also implement the use of portable monitors that measure hydrogen sulphide and hydrocarbons, allowing the operations staff to investigate potential sources of odour.

- d. StatoilHydro identified and evaluated 15 flaring scenarios; the evaluation focussed on ambient SO₂ concentrations that could occur from these flaring scenarios. The H₂S concentrations associated with flaring will depend on the H₂S to SO₂ conversion efficiency associated with the flaring. If 100% conversion efficiency is assumed, there would be no H₂S. Based on 98% conversion efficiency, a value that has been used for controlled flaring events, a ground-level SO₂ concentration of 450 ug/m³ results in a ground-level H₂S concentration of about 5 ug/m³.

The Alberta Ambient Air Quality Objective (AAAQO) for H₂S is 14 ug/m³. Based on a conversion efficiency of 98% and a maximum SO₂ concentration of 450 ug/m³, the corresponding ground-level H₂S concentration is predicted to be less than 14 ug/m³. For flaring, as the SO₂ AAAQO is required to be met, the H₂S Objective is also met. The purpose of a flare management plan is to manage upset flaring so that the AAAQO for SO₂ is not exceeded. This should also have the effect of ensuring that the AAAQO for H₂S is also met. As a consequence, odours due to residual H₂S in these upset flaring cases are not expected.

In the unlikely event that odours are reported under these upset flaring scenarios, StatoilHydro will review the events that lead to the flaring and the circumstances during the flaring event to determine if there are corrective actions that could be applied to prevent recurrence.

Agency for Toxic Substances and Disease Registry (ATSDR). 2006. Toxicological Profile for Hydrogen Sulphide. U.S. Department of Health and Human Services. Atlanta, GA.

139	Volume 2, Appendix 4A, Section 4A1.1, Page 4A-1 Statoil states <i>Only airborne COPCs were determined to be relevant to the project.</i> a. Clarify if fugitive emission sources were included. If not, explain Statoil's rationale for not including them.
-----	--

Response

- a. Fugitive emissions sources were included in the air quality assessment and human health risk assessment.

140	Volume 2, Appendix 4B, Pages 4B-1 to 4B-10
	a. Provide a worked example for the multi-media HHRA (include the calculations for both human and game tissue concentrations).
	b. Provide the location in the Environmental Impact Assessment (EIA) of the predicted ground-level air concentrations of the COPCs evaluated in the HHRA.
	c. Not all information needed to replicate the multi-media calculations is provided in this appendix. Provide the location of this information if it is located elsewhere in the EIA. If it is missing supply this information (e.g., predicted background vegetation samples are said to be in Appendix 4D , but can not be found).

Response

- a. A quantitative assessment of chronic exposure and the potential risks to humans from chemicals associated with the Project is provided as a worked example in [Appendix A](#) of this document.
- b. Not all the predicted ground-level air concentrations for each individual receptor were provided in the Environmental Impact Assessment ([Volume 2, Sections 2 and 4](#)). These data have not been reproduced in the printed document but are provided on CD in [Appendix B](#) of this document.
- c. Refer to the worked example discussed in Part a above and the human health risk assessment ([Volume 2, Appendix 4E](#)) for data inputs.

141	Volume 2, Appendix 4D, Pages 4D-1 to 4D-28
	a. Confirm statistically that fish, vegetation and soil samples were of a sample size large enough to provide an adequate representation of the study area.
	b. What types of vegetation samples were taken?
	c. Discuss why Statoil did not take groundwater samples.
	d. Clarify when the surface water samples were taken. Were samples collected specifically for this project? If not, why?
	e. In Table 4D-2 a range of concentrations for the metals is presented. Explain how the ranges relate to the maximums presented.
	f. Discuss the appropriateness and limitations of using modeled versus measured data for soil and plants.
	g. Statoil states a <i>correction factor was applied to the data in the human health risk assessment</i> . Clarify how the correction factor was derived and applied to the air quality predictions.
	h. Provide a map(s) with locations of all vegetation and soil samples taken.
	i. Discuss how the chemical concentrations of the soil samples taken for the Statoil upgrader compared to other regional samples collected.

Response

- a. Please note that sampling and analysis of fish was not conducted for this Project.

The vegetation and soil sampling conducted for the StatoilHydro application was not based on statistical power. Samples were collected to provide general information as to whether or not chemicals of potential concern (COPCs) were being detected in soil and vegetation.

To date, 36 soil samples and 52 vegetation samples have been collected in support of the following applications:

- StatoilHydro Upgrader: 7 soil samples and 7 vegetation samples;
- Total Upgrader: 11 soil samples and 11 vegetation samples;
- Petro-Canada Oil Sands Inc. Sturgeon Upgrader: 4 soil samples and 7 vegetation samples;
- Shell Scotford Upgrader 2: 5 vegetation samples;
- North West Upgrading: 9 soil samples and 17 vegetation samples; and
- Synenco Northern Lights Upgrader: 5 soil samples and 5 vegetation samples.

None of the samples collected in support of these applications have detected measurable levels of polycyclic aromatic hydrocarbons (PAHs). The results of the samples collected by StatoilHydro are consistent with other sampling programs in the area, and add to the existing database of information.

Because PAHs are uniformly non-detectable, we are not able to show that the number of samples collected for the current human health risk assessment HHRA are representative of the study area and baseline conditions through statistical testing. The number of samples required to base conclusions on is a matter of

professional judgment as to the applicability of the sampling, the availability of information, feasibility of additional sampling and analytical limitations.

The rationale for establishing conclusions based on a subset of samples (7 soil and 7 vegetation) for the local study area is based on the feasibility that chemical levels in the study area are low or below their levels of analytical detection.

Because concentrations are consistently non-detect (and thus the limitations are related to analytical methodology as opposed to the number of samples), the analytical results do not provide enough information to calculate the variability, significance or confidence intervals. Nor is there enough information to confidently ascertain what the actual concentrations of the PAHs are.

The collection of additional samples is not expected to provide additional useful information, unless analytical methods with lower detection limits were used, assuming that is even possible. Therefore, the samples on which conclusions are based are considered adequately representative.

- b. The following vegetation samples were collected:
 - canola seeds and seed pods;
 - rose hips;
 - rhubarb;
 - mountain ash berries;
 - barley heads; and
 - wheat heads.
- c. The Hydrogeology section ([Volume 3, Section 5](#)) provides information regarding groundwater sampling. Since the filing of the original human health risk assessment (HHRA), groundwater analysis for PAHs has been conducted. See [SIR Response 127](#) above.
- d. The dates of the surface water quality sampling are shown in [Volume 3, Section 7.5.2, Tables 7.5-1 and 7.5-2](#). These samples were taken specifically for this project.
- e. The maximums presented in many instances should represent the maximum detected concentration, half of the maximum detection limit, or the only detection limit for that substance in vegetation. A modification has been made to the original table to reflect this more clearly.

Table 141-1 (Table 4D-2 Revised) Summary of StatoilHydro Vegetation Sampling Results 2007

	Range (mg/kg)	Maximum Concentration (Maximum Detected or ½ detection limit, mg/kg)
Metals		
Boron (hot water)	3.4 - 19.8	19.8
Chromium VI	<0.2	0.1
Mercury	<0.3	0.15
Antimony	<1 - <4	2
Arsenic	<1 - <4	2
Barium	<10 - 50	50
Beryllium	< 0.4 - <2	1
Cadmium	<0.1 - 0.3	0.3
Chromium	<1 - 1	1
Cobalt	<1 - <4	2
Copper	<5 - 9	9
Lead	<1 - <4	2
Molybdenum	<0.4 - 1.6	1.6
Nickel	<1 - <4	2
Selenium	<0.5 - 0.6	0.6
Silver	<1 - <4	2
Thallium	<0.3 - <1	0.5
Tin	<1 - 5	5
Vanadium	<1 - <4	2
Zinc	15 - 114	114
Polycyclic Aromatic Hydrocarbons		
	Highest Detection Limit (mg/kg)	Concentration (1/2 detection limit, mg/kg)
Acenaphthene	0.18	0.09
Acenaphthylene	0.18	0.09
Anthracene	0.18	0.09
Benz(a)anthracene	0.18	0.09
Benzo(b)fluoranthene	0.18	0.09
Benzo(k)fluoranthene	0.18	0.09
Benzo(ghi)perylene	0.18	0.09
Benzo(a)pyrene	0.18	0.09
Benzo(e)pyrene	0.18	0.09
Chrysene	0.18	0.09
Dibenz(ah)anthracene	0.18	0.09
Fluoranthene	0.18	0.09
Fluorene	0.18	0.09
Indeno(123cd)pyrene	0.18	0.09
2-methylnaphthalene	0.18	0.09
Naphthalene	0.18	0.09
Phenanthrene	0.18	0.09
Pyrene	0.18	0.09

- f. As summarized in [Volume 2, Appendix 4D](#), all soil and vegetation data for PAHs were below analytical detection limits. This is consistent with data for other Projects

in the area, suggesting that PAHs are not accumulating in soil or vegetation to an appreciable extent. For substances that are not accumulating in significant amounts in terrestrial biota, the predictive modeling approach is likely more accurate as it is scientifically based and accounts for important physical-chemical properties of substances.

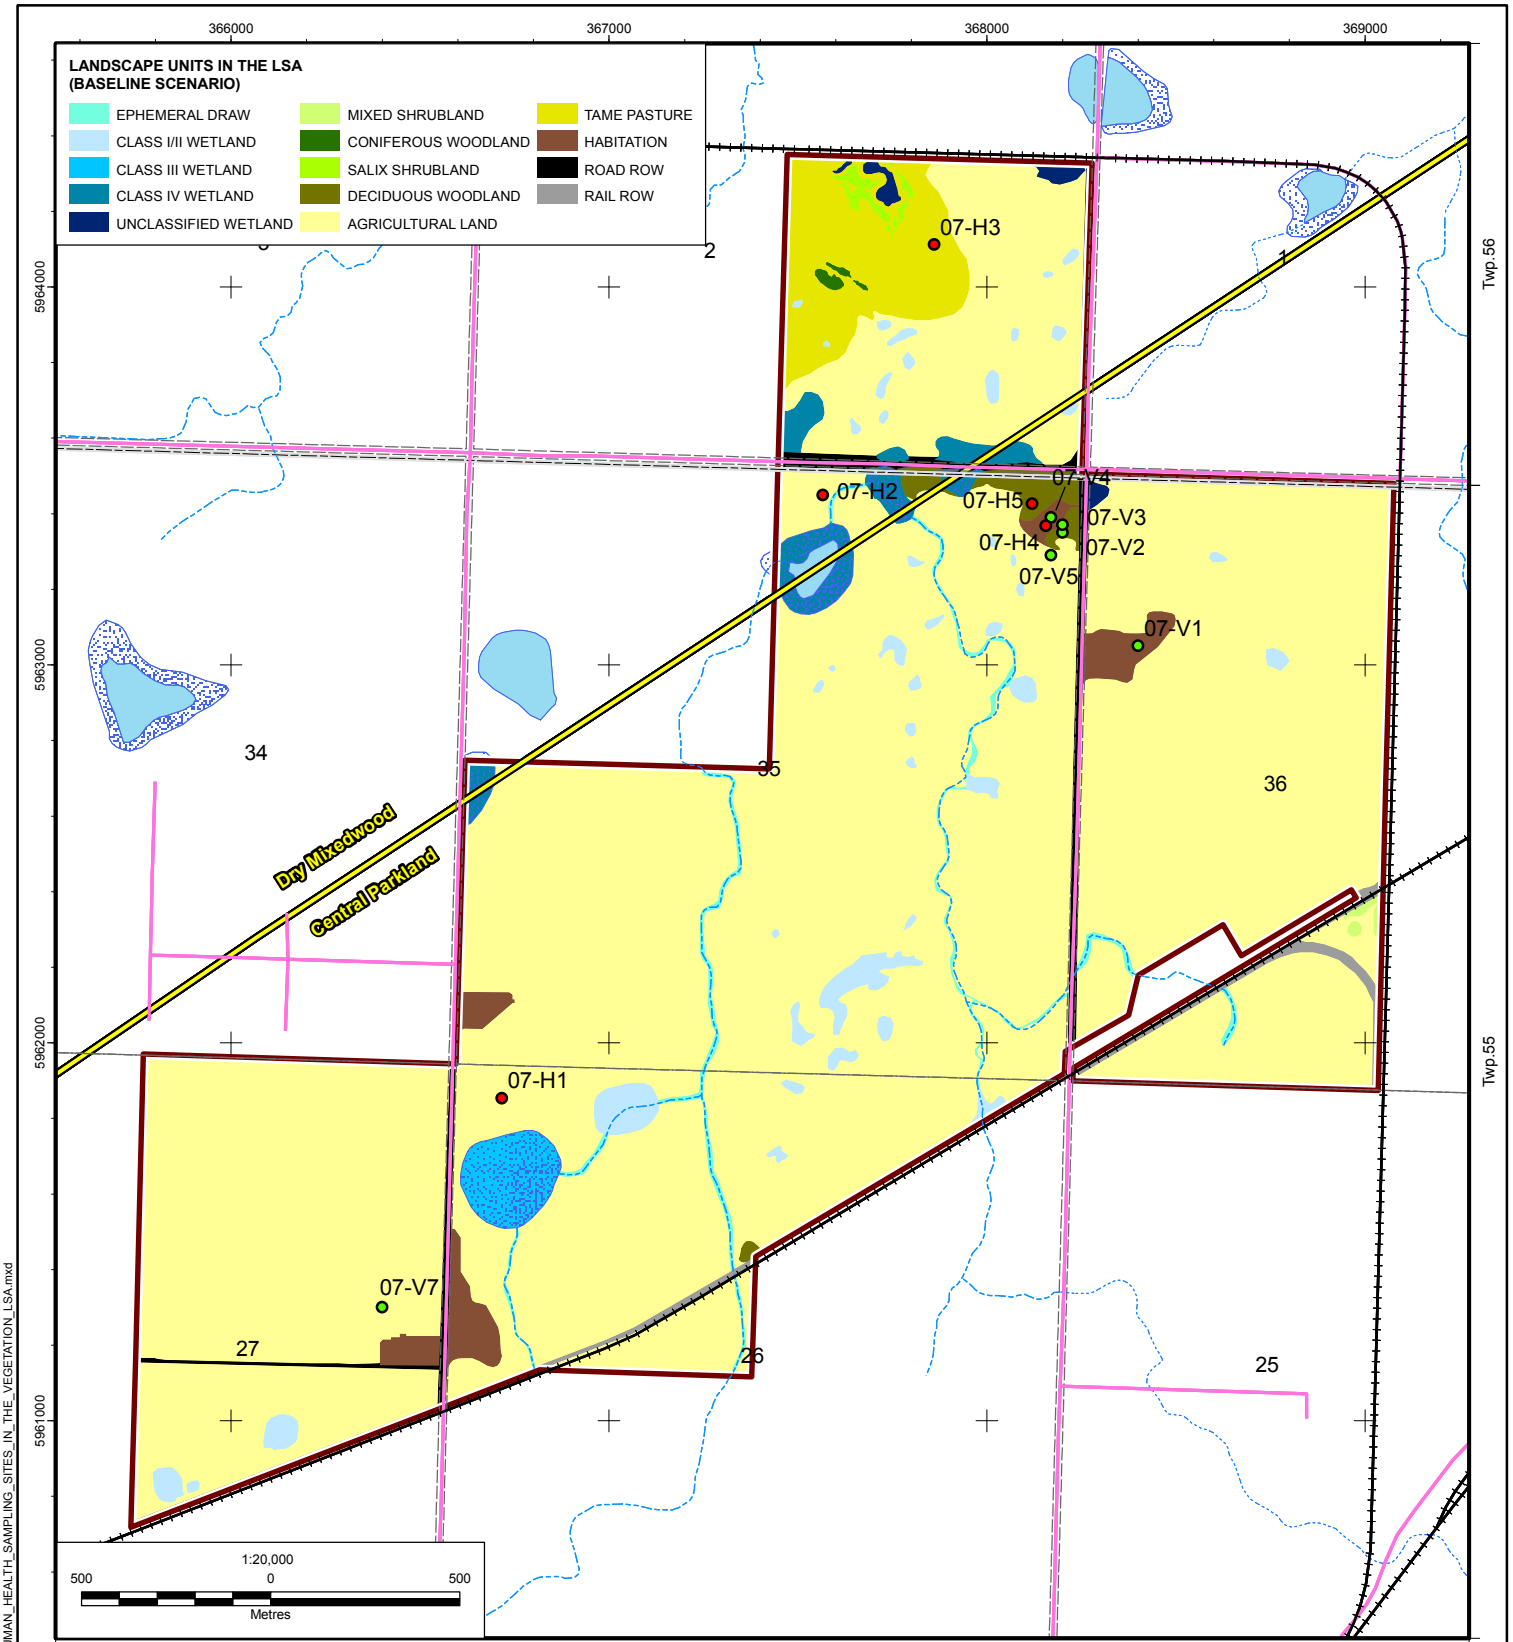

The alternative approach would be to assume one-half the analytical detection limit. However, there is significant uncertainty associated with this approach – i.e., we do not know if the concentration is close to zero, is half the detection limit, or is just below the detection limit. Given that all PAHs are present at levels below their analytical detection limits, the use of one half the detection limit is an assumption and does not represent a true measurement against which predicted data may be validated.

The use of predictive modelling to estimate environmental concentrations is science based and is considered suitable for estimating tissue concentrations.

- g. The correction factors were applied to substances whose predicted air concentrations were more than an order of magnitude below measured values from the study area or comparable areas (obtained from previous environmental impact assessments or literature). The correction factors were presented in [Volume 2, Appendix 4D, Table 4D-8](#). These were calculated for the selected substances by subtracting the difference between the average predicted concentration and the selected measured value.

As such, Conversion Factor = measured – predicted average.

- h. See [Figure 141-1](#), below.
- i. The measured soil samples for the StatoilHydro upgrader are comparable to samples taken for other projects in the area (Total E&P, 2007; PCOSI, 2007; North West Upgrading, 2007) in that PAH compounds were all below analytical detection limits.

142	Volume 2, Appendix 2E
	a. Complete an HHRA for upset and abnormal emission events. Include the frequency of exceedances.
	b. What mitigation measures (and their potential impacts) has Statoil considered for the flare management plan.

Response

- a. [Volume 2, Appendix 2E](#) ("Project Only Predictions"), [Section 2E1.5](#) provides estimated hourly SO₂ MPOI concentrations for 15 upset/emergency flaring scenarios for the Upgrader. These scenarios could potentially occur for periods ranging from 15 minutes to 24 hours. As all of these scenarios are less than 24 hours in duration, the discussion of potential health effects are limited to the acute inhalation pathway. The 99.9th percentile of the CALPUFF 1-h predictions for SO₂ were compared against the Alberta ambient air quality objective (AAAQO) of 450 ug/m³.

Of the 15 upset scenarios, SO₂ concentrations are predicted to exceed the AAAQO of 450 ug/m³ for Scenarios 4 and 9 only. Both scenarios are associated with flare blower failures and are expected to occur for 20 minutes once every two years. The 99.9th percentile hourly SO₂ concentrations associated with these events are 1,262 ug/m³ and 1,224 ug/m³, respectively. These predictions assume the simultaneous occurrence of the flaring event with poor dispersion conditions. The CALPUFF model predictions were reviewed to provide an indication of the frequency of exceeding the AAAQO. Assuming that flaring occurs continuously, the numbers of AAAQO exceedances are 18 and 16 h/y for Scenarios 4 and 9, respectively. If each scenario only occurs once every two years, then the joint frequency of a flaring event resulting in an exceedance is 1.17E-07 (= (18/8760)·(0.5/8760)), or once every 973 years for Scenario 4. The corresponding frequency of an AAAQO resulting from flare Scenario 9 is 1.04E-07, or once every 1,095 years.

As described in [SIR Response 44](#), during these emergency flaring scenarios, the overheads from the amine regeneration are assumed to be relieved to the hydrocarbon flare. Emissions modelling for the EIA assumed a very conservative, highly improbable case with two blowers failing at the same time. During normal operation, the acid gas is split evenly between the SRUs. If one SRU experiences operating problems, it will be shut down and the remaining SRUs will be ramped up to full capacity. The controlled release rate to the flare is therefore a fraction of that modeled in the application. Any release to the flare will start to diminish quickly as feed rates to the hydroprocessing units are reduced. In addition, the blowers are steam driven, with 100% electric standbys with auto start controls.

In clinical studies (ATSDR, 1998; Environment Canada, 1987; Linn et al., 1983; UK Dept of Health, 1995), clear respiratory responses have not been observed in healthy individuals exposed to brief periods of concentrations of SO₂ less than 2,000 to 2,600 ug/m³. At a concentration of 1,300 ug/m³, non-exercising asthmatics displayed a similar lack of respiratory response (Linn et al., 1983; Sheppard et al., 1981). [Table 142-1](#) presents a summary of the observed effects associated with short-term SO₂ exposures.

Table142-1 Summary of the Potential Short-term Health Effects of SO₂

Air Concentration (ug/m³)	Description of Potential Health Effects
530 to 1,300	Increased airway resistance and potential bronchoconstriction in asthmatic or sensitive individuals engaged in moderate exercise, but typically no effect on lung function in normal individuals.
1,300 to 2,600	Increased resistance in airways and difficulties breathing may be experienced by normal individuals (in addition to asthmatics and sensitive individuals). Sore throat and the ability to taste and smell SO ₂ may also be apparent. Effects in asthmatics and other sensitive individuals may also include wheezing, dyspnea, and bronchoconstriction.
2,600 to 13,000	Odour is detectable. Increased resistance in airways, decreased lung volume, reduced bronchial clearance and evidence of lung irritation (increased macrophages in lung fluid) has been observed at this exposure level. Headache, coughing, throat irritation, nasal congestion, increased salivation may be evident, and some symptoms may persist for several days after exposure. Mucociliary transport in the nasal passages may also be impaired, potentially leading to nasal congestion. Respiratory effects may be more severe in asthmatics and sensitive individuals.
13,000 to 26,000	Increased resistance in airways, decreased respiratory volume, difficulties breathing and lung irritation have been reported at this exposure level. Nasal, throat and eye irritation, nosebleeds, coughing, potentially accompanied by erythema of trachea and bronchi may occur. Respiratory effects may be more severe in asthmatics and sensitive individuals.
26,000 to 130,000	Symptoms of more severe respiratory irritation may appear, such as burning of nose and throat, sneezing, severe airway obstruction, choking, and dyspnea. Exposure may result in damage to airway epithelium that may progress to epithelial hyperplasia, an increased number of secretory goblet cells, and hypertrophy of the sub-mucosal glands. A condition known as Reactive Airway Dysfunction Syndrome (RADS) may arise in the concentration ranges (as well as above) as a result of bronchial epithelial damage. Chronic respiratory effects may develop. Eye irritation, watery eyes, and skin eruptions (rashes) may be evident. Respiratory effects may be more severe in asthmatics and sensitive individuals.
130,000 to 260,000	Symptoms of severe respiratory irritation may occur, such as bronchitis, intolerable irritation of mucous membranes in addition to other effects described above, such as decreased lung capacity and breathing difficulties, runny nose, eye and skin irritation.
>260,000	Immediately dangerous to life and health. Chemical bronchopneumonia and asphyxia have been reported at high levels of exposure. Death may result from severe respiratory depression at concentrations of approximately 2,600,000 ug/m ³ .

Alberta Health and Wellness (AHW) evaluated the potential health effects associated with short-term SO₂ exposures. Based upon a review of human clinical evidence, AHW (2006) concluded that healthy individuals exposed to concentrations up to 26,000 ug/m³ (10 ppm) could experience transitory effects on pulmonary function, under “exaggerated” conditions involving hyperventilation, mouth-only exposure and heavy exercise.

Thus, it is possible that sensitive individuals may experience respiratory effects in association with SO₂ exposure in the event of certain upset scenarios. Healthy individuals are less likely to experience adverse effects. The likelihood of the described maximum SO₂ air concentrations occurring is considered remote.

While the main substance of potential concern due to upset flaring is SO₂, the combustion process can also produce products of incomplete combustion that can include the substances identified in [Volume 2, Appendix 2A, Table 2A-18](#). Benzene was selected as a surrogate to evaluate the VOC emissions resulting from the products of incomplete combustion.

The benzene emission factor of 0.000559 lb benzene per million BTU indicated in [Volume 2, Appendix 2A, Table 2A-18](#) was used to estimate benzene from flaring. The maximum expected benzene concentrations associated with each upset flaring event assessed in the environmental impact assessment ([Volume 2, Appendix 2E](#)) was scaled from the predicted SO₂ concentrations. For the results for all the flare scenarios, refer to [Table 142-2](#).

For most events, the maximum 1-h average benzene concentration is typically 0.1 ug/m³ or less. There is one flare case where the maximum predicted 1-hour average is 0.113 ug/m³. As indicated in [Volume 2, Appendix 2B, Section 2B5.1](#), measured 1-h average benzene concentrations range from 0.4 ug/m³ to 1.03 ug/m³, depending on the measurement location. The mean measured benzene concentration is 0.65 ug/m³ based on six monitoring locations. While the maximum value associated with upset flaring can be relatively small with respect to the measured values, it is much less than the 1-h AAAQO of 30 ug/m³ for benzene.

The potential for acute adverse effects in relation to upset releases of benzene are anticipated to be minimal.

Table 142-2 Maximum 1-Hour Average Benzene Concentration from Upset Flare Events

Flare Scenario	Flaring Event	Emission Rates		Acid Gas	Natural Gas	Predicted 1-h SO ₂		Predicted 1-h Benzene	
		SO ₂	Benzene	Flow Rate	Flow Rate	Max	99.9th	Max	99.9th
		(t/d)	(t/d)	10 ³ m ³ /d	10 ³ m ³ /d	(ug/m ³)	(ug/m ³)	(ug/m ³)	(ug/m ³)

Notes:

Flow rates and SO₂ emission rates from Volume 2, Appendix 2E, Section 2E1.5.

Benzene concentrations are scaled from the predicted SO₂ concentrations.

The values for upset flaring Scenarios 13 and 14 have been updated (See Additional Errata section).

- b. StatoilHydro does not yet have a flare management plan in place. It will be developed prior to operation of the facility and revised during the first two years of operation based on operating experience. As stated in the response to Part a above and in [SIR Response 44](#), mitigation measures have been put into place to reduce the likelihood of these events occurring.

143	Volume 3, Section 5.6.1, Pages 5-39 to 5-40 With regard to groundwater quality impacts as a result of project activities, Statoil identifies six mitigation strategies for the project. Statoil then states <i>Because of these mitigative measures, the depth below ground surface and the low hydraulic conductivity of the overlying till, accidental releases from ground surface pose little threat to the Beverly Channel Aquifer.</i>
	a. Provide details of the spill, management and remediation plans that will be implemented.
	b. Discuss Statoil's spill response time in the event that a spill should occur.

Response

- a. As part of the site specific emergency response plan, StatoilHydro will have comprehensive spill response procedures in place prior to construction. Employees and contractors will be trained in response procedures. StatoilHydro will have spill response equipment on-site.

StatoilHydro is also a recent member of Northeast Regional Community Awareness and Emergency Response (NRCAER), an emergency response mutual aid organization with government and industry members. In the event of an emergency, StatoilHydro would be able to request assistance from NRCAER members. In addition to onsite spill response equipment and that of our immediate industrial neighbours, StatoilHydro is a member of the local spill cooperative, Western Canadian Spill Services (WCSS). The WCSS has a cooperative spill response skid trailer station in the Redwater area. If needed, additional WCSS spill response equipment, Oil Spill Containment Oil Spill Containment and Response (OSCAR) trailers and boats, are stationed near Acheson.

- b. As described in part (a), StatoilHydro will have procedures in place to immediately activate an Emergency Response Plan through 24-h contact numbers.

144	Volume 3, Section 5.6.2, Page 5-40 Statoil states <i>Measurable impacts to groundwater quality as a result of dewatering are not expected and are considered neutral, with a prediction confidence of high and final impact rating of no impact (table 5.6-2).</i>
	a. Provide evidence to support this conclusion.

Response

- a. The following evidence is provided to support the conclusion:
- Dewatering of groundwater would maintain the shallow water table at a level at or below the base of the ponds and excavations.
 - Liners will be installed at the base of these ponds to prevent infiltration of potentially contaminated water to the groundwater system.
 - Dewatering will not include the introduction of any additional substances to the clay till unit.
 - During the operational phase, groundwater monitoring wells will be installed to monitor groundwater levels and quality near dewatered zones.

145	Volume 3, Section 5.8, Page 5-45 <i>Statoil states A groundwater monitoring program will be implemented to monitor groundwater levels, flow conditions, and groundwater quality at the Project site.</i>
	a. Discuss the proposed mitigation actions should this program identify negative impacts to groundwater levels or quality.

Response

- a. Based on the results presented in [Volume 3, Section 5](#), it is unlikely that the Project will have any effect on groundwater quality. However, should StatoilHydro identify negative impacts to groundwater levels or quality beyond that of normal variability, StatoilHydro will promptly notify Alberta Environment. As described in [Volume 3, Section 5.8.1](#), an appropriate plan of action would be developed at that time, in consultation with Alberta Environment. At present, it is not possible to identify specific mitigation options because mitigation is situation dependent.

146	<p>Volume 3, Section 7.7.1, Pages 7-40 to 7-41</p> <p>With respect to erosion and sediment loading due to construction activities, Statoil lists mitigation measures and states <i>With mitigation the residual effects of sediment release on surface water quality will be low in magnitude, short-term in duration and reversible, and will have a low overall environmental consequence.</i></p> <p>a. Provide evidence to support this conclusion.</p>
-----	--

Response

- a. This conclusion is based on professional experience with similar projects where these mitigation measures have been applied. The application of the best management practices to control erosion and sediment release ([Volume 3, Sections 7.7.1 to 7.7.3](#)) will minimize the release of sediment to local waterbodies. No release of surface runoff or dewatering waters will occur until the water meets appropriate water quality standards.

TRANSPORTATION

147	<p>Volume 5, Section 15.6, Pages 15-25 to 15-27, Strathcona Area Industrial Heartland Transportation Update Report</p> <p>There appears to be a few inconsistencies between the information contained in the EIA report and the information in the Strathcona Area Industrial Heartland Transportation Study Update Report (SAIH Report).</p> <p>a. Where there are inconsistencies between the SAIH Report and the EIA report clarify which information is correct (e.g., main site access, Operations and Maintenance workforce numbers).</p> <p>b. What transportation changes has Statoil made since the development of the SAIH report?</p> <p>c. How will these changes impact the traffic assessment information presented in the SAIH report (including site traffic re-assignment)? Provide updated traffic assessment information as necessary.</p> <p>d. How will Statoil's recent announcement to delay the startup of the upgrader impact the timing of the recommended road improvements?</p>
-----	--

Response

- a. StatoilHydro's proposed access location and proposed route has not changed since the development of the of the Strathcona Area Industrial Heartland Transportation Study Update (SAIH) report. The peak construction workforce quoted in the EIA is the same as quoted in the Strathcona Area Industrial Heartland Transportation Study Update Report (SAIH Report). However, in [Volume 5, Appendix 15A, Section 15A6.1.1](#), slightly higher peak construction workforce numbers are quoted and it is noted that these numbers are conservative. [Volume 5, Appendix 15A, Section 15A6.1.1](#) provides further explanation.

The SAIH report and the transportation analysis outlined in [Volume 5, Appendix 15A](#) quotes the same number of day-time operations workers. The socio-economic impact assessment (SEIA) analysis focuses on the total number of operations workers. The number of quoted day-time workers is consistent with the number of total operations workers.

Further to this information, the transportation analysis completed for the Application is a more detailed look at the StatoilHydro project and is therefore the correct document to reference at this time.

- b. StatoilHydro has not made any transportation changes since the development of the SAIH report so there is no need for a change in the traffic assessment.
- c. See response to Part b, above.
- d. A start-up delay will allow for more time to plan and resolve possible issues and will also decrease the overlap in the construction peaks of StatoilHydro and the surrounding sites.

148	<p>Volume 5, Section 15.6.4, Page 15-27 Statoil states <i>North American will work with other stakeholders to follow up on possible implementation of recommended road improvements arising out of the 2007 SAIH Transportation Study.</i></p>
	<p>a. Discuss any initiatives Statoil has pursued to date.</p>
	<p>b. Outline the process or approach Statoil will use to achieve cooperation with other stakeholders to ensure that the possible road improvements can be implemented.</p>
	<p>c. Based on the SAIH Report, neither Alberta Transportation nor Fort Saskatchewan / Strathcona County will fund the improvements recommended in the report. Outline how these improvements will be funded.</p>

Response

- a. StatoilHydro has actively participated in the preparation of the 2007 Strathcona Area Industrial Heartland Transportation Study Update (SAIH) Report through review, submission of data and provision of funding. StatoilHydro has also attended several meetings, presentations and workshops involving other stakeholders, Strathcona County and Alberta Transportation involving discussions about infrastructure issues within Alberta's Industrial Heartland area. The participation by StatoilHydro in these initiatives began in August 2006 and is on-going.
- b. StatoilHydro will continue to monitor the issues regarding infrastructure in the region by contributing time and resources. On June 3, 2008, StatoilHydro participated in a meeting chaired by Strathcona County to begin the process of determining the infrastructure needs for the Upgrader and the interface with ATCO Pipelines Caverns, Providence Grain Terminals, CPR Logistics Centres and the Proposed Bunge Oil Seed Processing Facility. This meeting was convened at the request of Strathcona County and was the first of a series to begin the process of need identification for all parties, identify recommendations for development and ultimately set a funding methodology that would include industry, Strathcona County and Alberta Transportation.
- c. The model for funding improvement projects has been discussed between industry and regulators on several occasions. At this time, none of the traffic improvement projects have been deemed to benefit StatoilHydro. It is expected that once the StatoilHydro Upgrader is approved, necessary infrastructure developments will be funded in similar fashion to those projects currently proceeding. That model has been funded largely by industry but also some funding has been provided by Strathcona County and, where programs are in place, the Province.

149	<p>Volume 5, Section 15.6.4, Page 15-27 and SAIH Report Section 4.1.2, Page 18 (Recommended Transportation Network, Roadway Network, Assessment)</p> <p>The SAIH Report identifies the need for signalization at the Hwy 15 and RR 212 intersection and the need for twinning Highway 15 between RR 214 to East of RR 212, however, these recommended improvements are not in the current construction program of Alberta Transportation. Figure 15.6.1 of Volume 5 shows that 4-laning of Highway 15 is not required between Hwy 830 (West Junction) and RR 212. This contradicts the SAIH Report recommendation (SAIH Section 4.12, Page 18) which indicates that signalization would trigger the need for 4-laning Hwy 15 from Hwy 830 (West Junction) to east of RR 212.</p>
	a. Confirm the timings of these improvements (i.e., will they be required prior to the start of the project? If they are not needed at the outset of the project, when will each transportation network improvement be needed?)
	b. Explain how these improvements may be funded.
	c. Provide intersection improvement details for both AM and PM peak periods, at critical time horizons as well as any other stage construction time horizons.
	d. Indicate if the proposed 2-lane cross-section on RR 212 from Hwy 15 to the Canadian National Rail tracks will provide adequate storage in case of a train occupying the crossing during the peak site inbound traffic period (i.e. Will the single lane storage along RR 212 be sufficient for the northbound inbound traffic so that the queue will not back up into Highway 15?).
	e. Confirm that Hwy 15 from Hwy 830 (West Junction) to East of RR 212 will need to be 4-laned.

Response

- a. **Twinning on Highway 15:** [Volume 5, Appendix 15A, Section 15A6.4.2](#) indicates that for the 2017 construction peak, “a four-lane cross-section of Highway 15 is necessary near the intersection of Highway 15 – Range Road 212. If four lanes are built near Range Road 212, it may be practical to continue the four-lane cross-section from Range Road 213 to Range Road 212 for continuity.” This indicates that twinning may be a practical upgrade on this section of Highway 15, but that twinning is not required. The figures have been changed to reflect necessary improvements as follows:

- [Figure 15.6-1 \(Volume 5, Appendix 15A, Figure 15A-7\)](#): the limit of the four-lane section east of Highway 830(W) has been extended to a more accurate location closer to Range Road 213. See [Figure 149-1](#) (Figure 15.6-1 Revised).
- [Figure 15A-6](#): a two-lane section is now shown from west of Range Road 213 to west of Range Road 212. See [Figure 149-2](#) (Figure 15A-6 Revised).

Timing of Improvements: Minor intersection improvements (eastbound and westbound left-turn bays) are required at Highway 15 – Range Road 212 prior to the 2012 construction peak and twinning of Highway 15 is required for the 2017 peak. The intersection improvements described in [SIR Response 149 c](#), below, will be required when the workforce reaches approximately 1,700 workers on-site per day. The improvements will need to be constructed in 2015. It may be practical to

implement all changes at the same time, prior to the 2012 peak, subject to available funding.

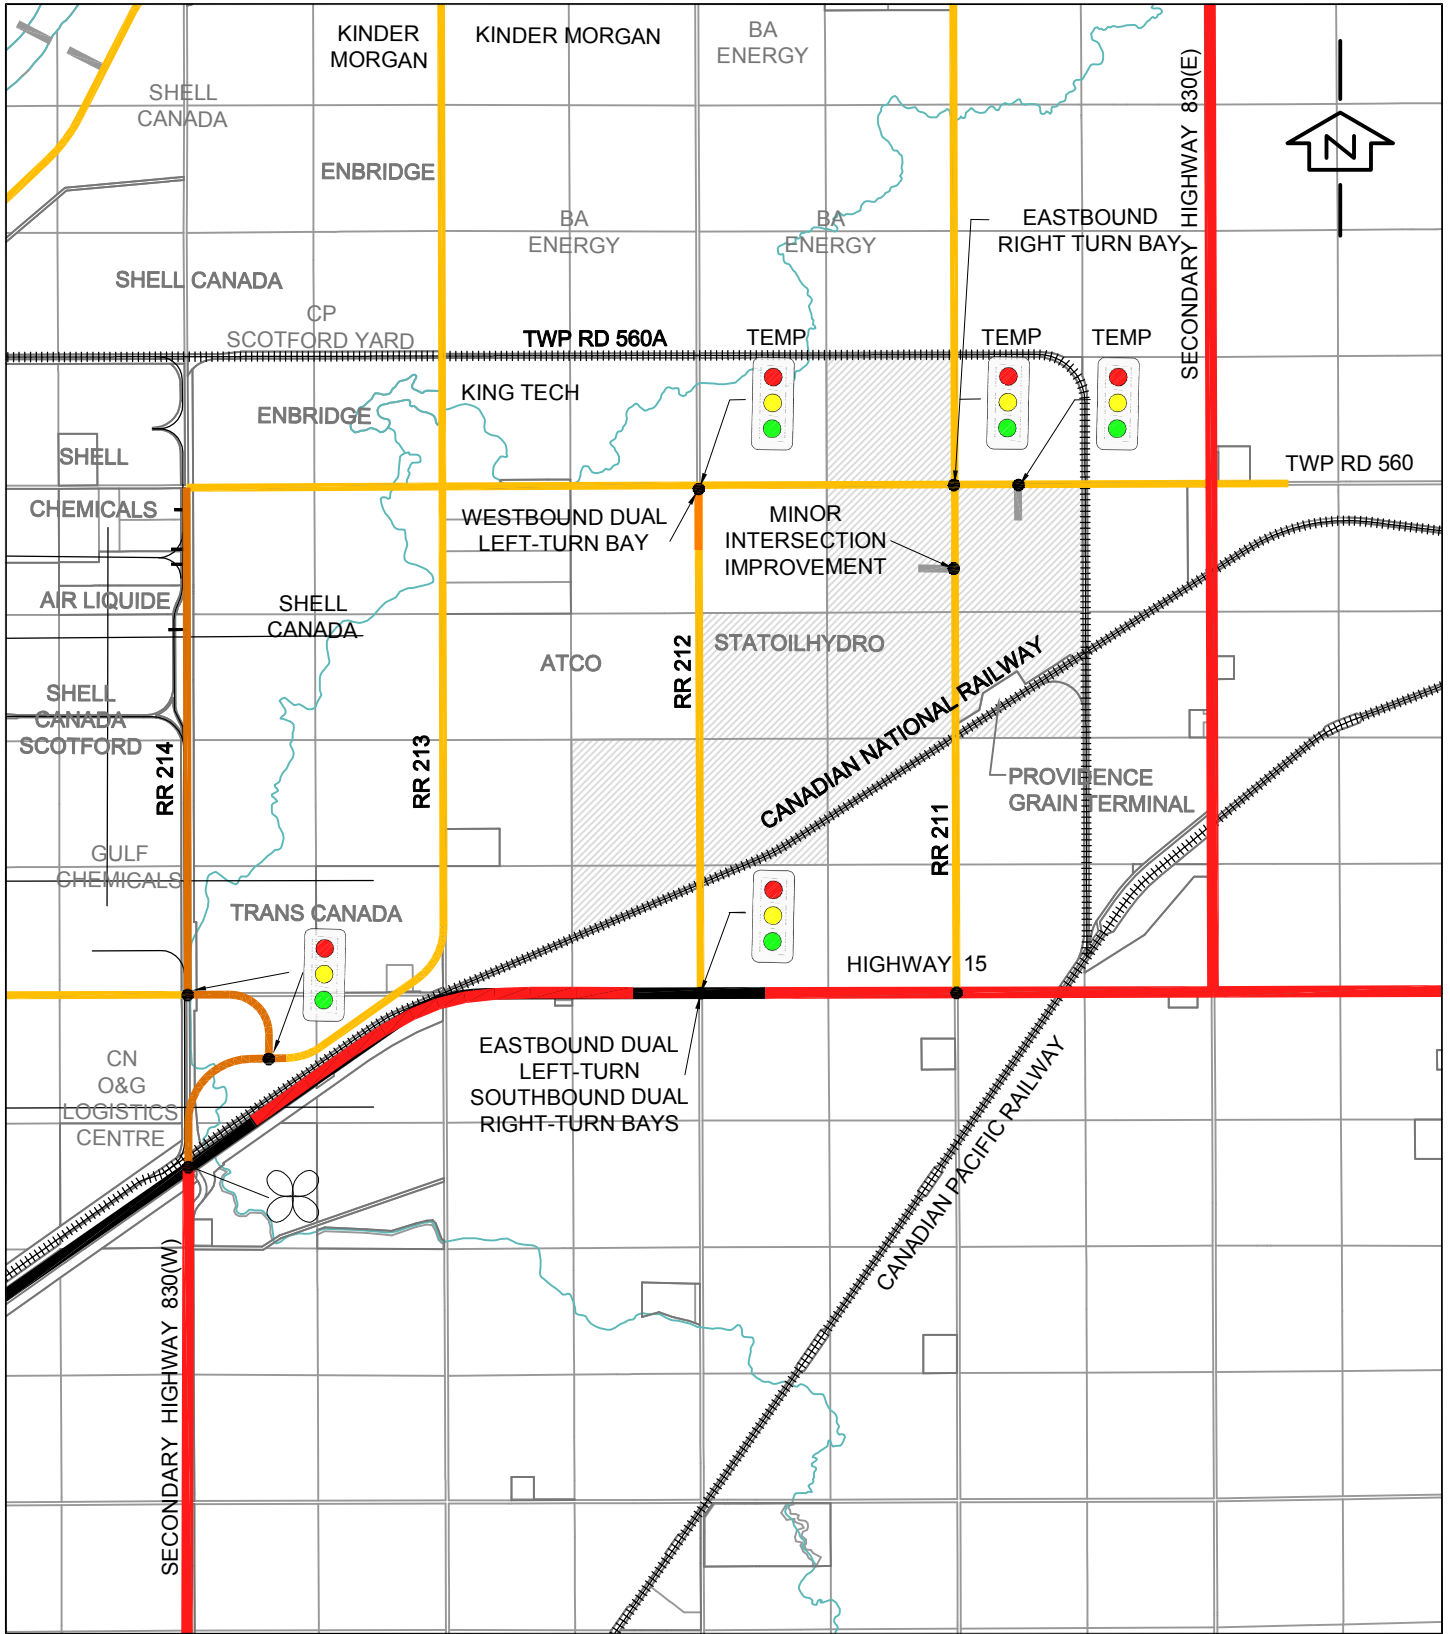

- b. See [SIR Response 148](#), above.
- c. The following improvements to the Range Road 212 – Highway 15 intersection are required to facilitate the 2017 peak hour traffic volumes:
- 2 southbound right-turn bays: 170 m bay with a 90 m taper;
 - 2 eastbound left-turn bays: 230 m bay with a 140 m taper;
 - 1 westbound left-turn bay: 110 m bay with a 210 m taper; and
 - 1 southbound left-turn bay: 75 m bay with a 210 m taper.

Lengths were calculated using the 1999 Alberta Transportation Highway Geometric Design Guide based on the design speeds and number of lanes and take into account the 95th percentile queue length for each movement.

- d. There is approximately 650 m of storage on Range Road 212 between the CN Rail tracks and Highway 15. To analyze this scenario, a 3.2 km train was assumed to travel at 50 km/h on the tracks crossing Range Road 212. This means the train will take four minutes to clear the intersection. The AM peak northbound traffic volume on Highway 15 is 1040 veh/h, meaning that the roadway will be completely filled in five minutes. This is a close margin, and in the event of a stopped train, the queue could potentially spill back to Highway 15.

Queue-cutter signal pre-emption is recommended at this intersection. Sensors on Range Road 212 will detect northbound vehicles and prompt the signal to prohibit the eastbound left-turn movement (which supplies 99% of the northbound traffic) and the northbound through movement when the queue becomes too long. In addition, variable message signs should be used to re-route eastbound left-turning traffic to Range Road 211 if the turn bays on Highway 15 are nearing capacity.

- e. See the response to Part a, above.

150	<p>Volume 5, Section 15.8, Page 15-50</p> <p>Statoil states <i>It also will contribute to the need for some government infrastructure spending, such as improvements to Highway 15...</i> and Statoil states <i>As part of ongoing community engagement by North American, the Project is expected to undertake community investment and initiatives to address some of the challenges in the social sphere. The taxes it pays contribute to the ability of Strathcona County and the Province to respond to the growth challenges, and both levels of government have put in place mechanism to respond.</i></p> <p>a. Confirm if the above statements are implying that Statoil is in the process of developing levies and/or other funding arrangements to facilitate transportation improvements in partnership with other industrial proponents or with the affected municipalities. What progress has been made on this to date?</p>
-----	---

Response

- a. See [SIR Response 148 c](#), above.

151	Volume 5, Figure 15.6.1, Page 15-28 Figure 15.6.1 shows there will be an intersection on Highway 15 at RR211. This does not agree with the SAIH Report (Section 4.1.1, Page 17), which states <i>Spacing of intersections along Highway 15, currently 1 mile, should desirably be 2 miles...this would suggest that existing intersections at RR 215, RR213 and RR211 should, if possible, be eliminated.</i>
	a. Confirm if and when RR 211 will be closed (Will it be at the time when RR 212 is signalized?).

Response

- a. StatoilHydro does not have the authority to close any roads within Strathcona County nor has StatoilHydro made a request to have Range Road 211 closed at Highway 15. The Upgrader Project traffic planning has determined that this road is not required for our construction or operational traffic. This road is important to others residing along Range Road 211, such as Providence Grain. StatoilHydro has participated in an initial meeting to determine infrastructure requirements specific to roads directly affected by developments around Range Roads 211 and 212.

152	<p>Volume 5, Section 15.6.4, Figure 15.6.1, Page 15-28</p> <p>Figure 15.6.1 shows that the intersection of Hwy 830 (East Junction) and Hwy 560 will not be used as a site access in 2017. Statoil does not mention there will be improvements at this intersection. Figure 15.6.1 also does not show any upgrading of the Highway 830 (East Junction) and Highway 15 intersection and there is no discussion on whether the current intersection configuration at Highway 830 (West Junction) and Highway 15 will be adequate with the added traffic from the proposed development.</p> <p>a. Confirm if the intersection at Hwy 830 (East Junction) and Hwy 560 will be utilized as a site access. Clarify what mechanisms were considered to ensure or enforce that this access would not be impacted by the traffic generated by the proposed development.</p> <p>b. Provide discussion to confirm if intersection improvements will be needed at the intersection of Highway 830 (East Junction) and Highway 15. If improvements are required, provide a description of the improvements.</p> <p>c. Provide discussion to confirm if intersection improvements will be needed at the intersection of Highway 830 (West Junction) and Highway 15. If improvements are required, provide a description of the improvements.</p>
-----	--

Response

- a. There will be minimal usage of Highway 830 (E) – Township Road 560, as only 5% of the site-generated traffic is assumed to be distributed to the north via Highway 830. This assumed distribution was determined using information generated by StatoilHydro and logical destinations based on nearby populations.

The minimal traffic volume increases at this intersection (e.g., 20 to 25 eastbound left-turning vehicles in the PM peak) will not necessitate improvements.

- b. See the response to Part a, above.
- c. The proposed intersection improvements to Highway 830 W and Highway 15 are dependent on a greater regional need rather than due to traffic associated specifically with the Upgrader Project. However, any intersection improvements will serve to improve traffic access to the site.

SOCIO-ECONOMIC IMPACT ASSESSMENT

153	<p>Volume 5, Section 15.5, Page 15-21</p> <p><i>Statoil states Assuming current schedules, the cumulative construction workforce requirements for upgrader projects in Sturgeon County and Strathcona County is estimated to peak at 16,000 on-site workers. This estimate is subject to considerable uncertainty, in that each project included in the Cumulative Case may experience changes in project execution, thus affecting scope and timelines.</i></p> <p>a. What steps has Statoil taken to manage its peak workforce requirements to minimize the cumulative labour requirements and the potential for labour shortages?</p>
-----	---

Response

- a. One factor that informed StatoilHydro's decision to delay construction of the Project by two years is the current high cost construction market in the Province. A two-year delay will shift the Project's first phase peak from the projected cumulative construction peak in the Alberta Industrial Heartland. This in turn is expected to assist the company in its ability to source the required labour.

StatoilHydro is undertaking the following strategies to manage its peak workforce requirements:

- utilizing an execution strategy that includes off-site module fabrication as a strategy to mitigate on-site labour force requirements;
- developing the Project in a phased manner;
- building flexibility into the design of the Project in the gasifier and hydrogen components; and
- in the event of a prolonged labour shortage, StatoilHydro will explore the option of recruiting temporary foreign workers with the appropriate skill set and knowledge.

154	<p>Volume 5, Section 15.5, Page 15-21</p> <p><i>Statoil states ... the evidence suggests that the estimated peak demand of 16,000 construction workers in the AIH will be met by: the estimated regional supply of 8,500 to 9,000 construction workers with the appropriate skills for heavy industrial construction who are resident in the region, taking into account that at least some of the RSA-based workers will continue to work on projects in the Wood Buffalo region, and an estimated 7,000 to 8,000 workers from outside the region...It has been assumed that construction workforce requirements in excess of 8,750 workers will be met by mobile workers non-resident to the region.</i></p> <p>a. What percentage of the 8,500 to 9,000 regional construction workers has Statoil assumed will be drawn from the Wood Buffalo Region?</p> <p>b. On what basis does Statoil expect that workers in the Wood Buffalo Region will return to work on this project?</p> <p>c. If the workers do not return from the Wood Buffalo Region, as expected, what are the implications for the number of assumed mobile workers non-resident to the region (estimated at 8,750)?</p>
-----	--

Response

- a. The 2007 estimate of 8,500 to 9,000 heavy industrial construction workers resident in the Capital region and available to work on upgraders is based on a number of sources, including discussions with unions. At that time, approximately 5000 were estimated to work in the Capital region, either on-site at heavy industrial projects or in fabrication yards. Approximately 5000 were working mobile, mostly in the Wood Buffalo region. It was estimated that of those 5,000 people, 75% of the Capital region-based mobile workers (3750 workers) would return to work on projects in the Alberta Industrial Heartland (AIH). This returning group of 3,750 combined with the 5,000 workers already present sum to a total estimate of 8,750.
- b. StatoilHydro's assumption is based on interviews with labour unions, which have a consensus view that many, although not all, Edmonton-based construction workers that are working mobile in the Regional Municipality of Wood Buffalo (RMWB) and elsewhere will prefer to work on AIH projects, including the StatoilHydro Upgrader. Labour organizations have already observed this trend, where members who were previously working in the RMWB have now started working on AIH projects.

In addition, according to a Nichols Applied Management survey of mobile workers in the RMWB undertaken in 2007 (as referenced in [Volume 5, Section 15.4.6.1](#)), the majority of workers expressed the opinion that they would be working less in the RMWB over the next three years. It is assumed that for the Edmonton-based workers, AIH projects offer an appealing alternative.

- c. If fewer Edmonton region-based workers who are now working mobile return to work on AIH projects, then, other things being equal, the number of mobile workers in the region will increase. The total number of workers required to meet peak upgrader requirements in the AIH and thus the number of mobile workers needed is subject to uncertainty, because:

- Synenco Energy has withdrawn its regulatory application for its Northern Lights Upgrader; and
- the construction of both the BA Energy Heartland Upgrader and the North West Upgrader are delayed from their original schedules;

Considering the above-mentioned changes as well as StatoilHydro's strategic choice to delay construction by two years, the peak cumulative workforce demand forecasted for the AIH is estimated to be lower than at the time of preparing the Application assessment.

155	<p>Volume 5, Section 15.6.3, Page 15-27</p> <p>Statoil states <i>Municipal officials in Fort Saskatchewan have expressed concerns that the segment of Highway 15 within the limits of Fort Saskatchewan is reaching capacity during daily peak travel periods...Changes in regional road network will ease some of the traffic pressures. For example, Highway 21 between Highway 16 and Highway 628 is being twinned, including the twinning of the Highway 21 overpass at Highway 16. That said heavy truck traffic, including dangerous goods loads, combined with upgrader activity, may lead to the need for further upgrades to the road network. This need is being taken into consideration in the development of the Capital Region Integrated Growth Management Plan, as well as in the long-range plans of completing both the inner and other Capital Region ring roads.</i></p> <p>a. Provide an update on the Capital Region Integrated Growth Management Plan (CRIGMP) process and whether it has made any recommendations that will address these concerns.</p> <p>b. What has been Statoil's involvement in the CRIGMP?</p> <p>c. Outline any discussions Statoil has had with other parties (i.e., other Upgraders, Municipality and Alberta Transportation) to try to address transportation concerns within the limits of Fort Saskatchewan.</p>
-----	---

Response

- a. The Capital Region Integrated Growth Management Plan (CRIGMP) group was by invitation only and was represented largely by municipalities only and as a result StatoilHydro was not invited.
- b. StatoilHydro has not had any involvement in this group.
- c. As outlined in [SIR Response 148](#), StatoilHydro has been working with regional transportation stakeholder groups and the other upgrader projects since August 2006.

156	<p>Volume 5, Section 15.6.3, Page 15-27 Statoil states <i>The Transportation Technical Brief completed for the project and represented in Appendix 15A suggests the following road improvements to mitigate Project-related traffic impacts... These road improvements are in line with the SAIH transportation study recommendations for the County.</i></p> <p>a. What steps has Statoil taken to address the recommendations contained in the transportation study?</p> <p>b. Will these proposed improvements be in place before the project starts construction?</p> <p>c. Is the County/Province proceeding to implement the recommendations on its own or has Statoil been asked to make the improvements?</p> <p>d. Comment on whether Sturgeon County and Alberta Transportation officials are satisfied with the traffic mitigation measures and timing of the measures that Statoil has proposed.</p>
-----	---

Response

- a. The recommendations presented by StatoilHydro are consistent with the County's transportation plan in the region. As our Project is still in the planning stages there is time to finalize specific details in the plan.
- b. StatoilHydro intends to have the project specific improvements in place prior to construction.
- c. The County and the Province are currently working on two projects that are not specific to our project but will work to mitigate traffic issues in the general area of our project. These two projects are improvements to Township Road 562 between Range Roads 214 and 213, and Range Road 213 between Township Roads 562 and 564. These two projects are being funded by the Province, County of Strathcona and by industry most directly affected. When the StatoilHydro project proceeds to a point where infrastructure works must be undertaken it is our intention to seek similar funding structures where available or we would need to fund them on our own.
- d. The recommended traffic mitigation measures that StatoilHydro have proposed are consistent with the County of Strathcona's regional plan. It is our expectation that the County of Strathcona would be in support of those plans and would be in dialogue with Alberta Transportation with respect to aspects of the plans that affect the highway transportation network.

157	<p>Volume 5, Section 15.7.3, Pages 15-39 to 15-40</p> <p><i>Statoil states Demand will present a challenge to the fixed-roof accommodation market... New supply above the current hotel building rate might come forward although even the relatively long construction period of most projects in the Cumulative Case might not be enough to encourage significant expansion of the hotel room numbers... One option North American is investigating is the possibility of developing a worker village in close proximity to the Project site, with the intention of accommodating a certain percentage of its out-of- region workforce.</i></p> <p>a. What is the status of developing a workers' village in close proximity to the project site?</p> <p>b. Provide recent discussions with the Municipalities about developing a workers' village.</p> <p>c. Given the demands and short timelines what other options has Statoil explored to accommodate its workforce given the expected cumulative construction peak?</p>
-----	--

Response

- a. A study has been performed for StatoilHydro on accommodation alternatives to our base case of bussing workers from existing communities, for workers both in the construction and the operation phases of the Upgrader. There have been no decisions to deviate from our base case. We continue to investigate alternatives with the housing industry and other upgrader operators
- b. As no alternatives have been selected, no formal discussions have been held with any Municipalities regarding a workers village yet.
 - Informal discussions have taken place with the Chief Administrative Officer for the Town of Bruderheim on possibility of in town site for accommodation but no application has been made.
 - Informal discussions have taken place with the CAO for the Town of Lamont on possibility of in town site for accommodation but camps will not be permitted.
 - Informal discussions with Lamont County have determined that camps are not permitted unless the development is in the County.
 - No discussions have taken place with Strathcona County which does not allow camps.
- c. StatoilHydro is committed to bussing of workers from regional communities to the Project site. Due to the delay of the StatoilHydro Project and the cancellation of the Synenco project it is more likely that this base case will go forward as the construction peak has now been reduced.

158	<p>Volume 5, Section 15.7.1, Page 15-42</p> <p>Statoil states <i>Some issues relative to emergency services include: A mixed level of coordination of service delivery among municipalities, challenges in some jurisdictions, including Fort Saskatchewan and the County of Lamont in meeting the rising cost of ambulance services.</i></p> <p>a. Does Statoil have cooperation protocols in place with the local and regional emergency service providers that cover upgrader construction and operations?</p>
-----	--

Response

- a. Cooperation protocols will be established with local and regional EMS providers closer to construction startup. In addition, StatoilHydro has recently joined the Northeast Community Awareness and Emergency Response (NRCAER) group, which will provide support to StatoilHydro in the event of an emergency. This group consists of over 40 industry, municipality and provincial government agency representatives who cooperate on issues of emergency response.

159	Volume 5, Section 15.7.2.1, Page 15-31 and 15-32 Statoil states <i>Strathcona County released its new Municipal Development Plan (MDP) in 2007. As of October, there is some uncertainty regarding the MDP, as it is under appeal by the City of Edmonton...From the County perspective, the main issue to be resolved is that of regional cooperation and potential governance issues being addressed in the Capital Region Growth Management Plan Process currently underway.</i>
	a. Could the appeal or CRGMPP potentially impact the Strathcona County Municipal Development Plan in a way that could affect the Statoil Project? Explain.

Response

- a. On June 28, 2007, in accordance with Division 11, Section 690 of the *Municipal Government Act*, the City of Edmonton gave notice that it was appealing Strathcona County's Municipal Development Plan (MDP) Bylaw 1-2007. Since filing, the City of Edmonton has narrowed the scope of the appeal to Strathcona County's proposed growth areas at the boundary with the City and in the vicinity of the Clover Bar Heavy Industrial Area.

The proposed location of StatoilHydro's Upgrader is outside of the areas affected by the City of Edmonton appeal. The appeal does not affect the Project's development plan.

The Capital Region Integrated Growth Management Plan (CRIGMP) and newly formed Board is focussing initially on regional issues pertaining to land use planning, inter-municipal transit, geographic information services (GIS), and affordable housing. Its secondary priorities include planning and monitoring of water and waste management, policing, emergency services, social services, recreation and economic development. Initiatives under CRIGMP aim to have a positive impact on the region's ability to deal with growth pressures and thus, on StatoilHydro's ability to execute its project. CRIGMP is in its infancy and at this point it is unclear how it may affect the Strathcona County MDP.

WATER ACT

160	Volume 1, Section 4.3.3, Page 58 Statoil states <i>The average annual volume of water that may be diverted to the stormwater ponds is 114,000 m³.</i> Confirm that the Statoil <i>Water Act</i> application is based on an annual volume of surface runoff that can be expected to be exceeded every second year, on average, rather than a volume of surface runoff that is based on a 1 in 10 “wet” year.
-----	--

Response

The 114,000 m³ is a mean annual or 1:2 year estimate. Review of regional hydrometric station data suggest a 1:10 year wet year runoff volume may be expected to be in the order of 265,000 m³.

ENVIRONMENTAL PROTECTION AND ENHANCEMENT ACT

161	<p>Volume 1, Section 4.1.1, Page 42 EPEA <i>Guide to Content for Industrial Approval Applications</i> item 5.21 requires <i>Details on any auxiliary or standby process equipment or other sources of emissions.</i></p> <p>a. Clarify if Phase 1 or the Project will have auxiliary or standby power generation. If so, provide information and details on related emissions.</p>
-----	---

Response

- a. Phase 1 and the Project will both have emergency standby power generation. [Table 161-1](#) below provides the emission profiles for these diesel generators.

Table 161-1 Diesel Generator Emission Profiles

Source identification #		Phase 1 Units	Future Units
		8	27

ERRATA

162	Volume 2, Section 2.7.1.2, Pages 2-34 and 2-35
	a. In the second bullet from the top of page 2-35, it should read “(Cases I and J)” instead of “(Cases J and K)”.
	b. In the next paragraph, it should read “Case J” instead of “Case K”.

Response

The errata as indicated are correct.

163	Volume 2, Section 2.9.1, Page 2-118 a. In the second paragraph, the last sentence should read <i>The model predictions reinforce the benefit of operating the SRU/TGTU complexes near the design value of 99.8% sulphur recovery</i> instead of 98%.
-----	--

Response

The erratum as indicated is correct.

164	Volume 4, Section 10.5.2.3, Pages 10-18 Statoil states <i>One Restricted weed, scentless chamomile (Matricaria maritime)</i> , was recorded along the roadside at the site of two meanders in Class IV Wetlands.
	a. Confirm that the species should read <i>Matricaria maritima</i> .

Response

That is correct. The species should read *Matricaria maritima*.

165	Volume 4, Section 10.5.2.3, Table 10.5-2, Page 10-18 In Table 10.5-2 Statoil states that <i>Matricaria maritima</i> is an Alberta Restricted Weed. Identify the source of the reference for <i>M. maritima</i> as being found in Alberta and as being a Restricted Weed.
-----	--

Response

Matricaria maritima should have been listed as an Alberta Noxious Weed. The source is the Government of Alberta, specifically the webpage of Alberta Agriculture and Rural Development: [http://www1.agric.gov.ab.ca/\\$department/deptdocs.nsf/all/faq8261](http://www1.agric.gov.ab.ca/$department/deptdocs.nsf/all/faq8261)

166	<p>Volume 4, Section 11.6.2, Table 11.6-3, Page 11-66</p> <p>Some of the percent change calculations (Application Case) for great-horned owl and songbirds appear to be incorrect. For example, for the great-horned owl, Low species suitability rating, there are 502.8 ha of habitat at baseline and 57.8 ha at application, a percent change of -88.6. The table shows the percent change as -31.9. Clarify this apparent discrepancy and update the table accordingly.</p>
-----	--

Response

Volume 4, Section 11.6.2, Table 11.6-3 has been updated as follows.

Table 166-1 (Table 11.6-3 Revised) Habitat Suitability and Availability for Baseline and Application Cases in the LSA

1 INTRODUCTION

This appendix provides technical information related to the quantitative assessment of chronic exposure and the potential risks to humans from chemicals associated with the proposed StatoilHydro Upgrader, herein referred to as the "Project".

Exposures to chemicals of potential concern (COPCs) were estimated at specified receptor locations, based on the following factors:

- Background or existing exposure to be estimated with relevant and available measured information;
- Specific physical, chemical and biological factors that determine the rate and amount of uptake of chemicals into the body;
- Physical and chemical characteristics which determine the interaction and behaviour of a chemical with its surrounding environment (e.g., water solubility, volatility, tendency to bind to particles);
- Characteristics of the sites and surrounding areas;
- Characteristics of the environmental media at the sites (e.g., air and soil), as well as the concentrations of chemicals entering the environment from various sources, and their persistence in the environment;
- Behavioural and lifestyle characteristics of potentially exposed human receptors (e.g., respiration rate, body weight); and,
- Assumed empirical or theoretical mathematical or statistical relationships between human exposure variables.
- Predictions for existing air quality data were provided for the discrete receptor locations by the Air Quality team to provide an accurate estimate of ambient air predictions.

A summary of the available data (chemical concentrations) in soil, water, plants and game that were used to characterize background exposures is included within Appendix D of the original HHRA and in the responses to [SIRS 127](#) and [128](#) from July 2008. Background exposures were estimated separately from exposures associated with the three development cases (i.e., baseline, application and CEA) which were estimated from exposure modeling.

Background exposures were added to baseline, application and CEA cases for threshold chemicals. Incremental cancer risks (not including background risks) were estimated for non-threshold chemicals (i.e., carcinogens) as recommended by Health Canada (2006) and AENV (2006).

Polycyclic aromatic hydrocarbons (PAHs) have been analyzed in soil and vegetation from the region but were seldom detected. Volatile organic compounds (VOCs) have typically not been analyzed in background assessments, as they are highly volatile and are generally not deposited to the terrestrial or aquatic environments. Background

exposures to PAHs and VOCs were estimated from models that predicted uptake to environmental media (i.e., soil, water, plants and game).

2 ASSUMPTIONS AND METHODOLOGY

In order to quantify potential human exposures (and associated health impacts) as a result of emissions from the proposed project, measured and predicted chemical concentrations in various environmental media were required to estimate exposures and characterize risks. An inhalation assessment was conducted on both an acute and chronic basis for all identified COPCs. In addition, chemical concentrations in the following media were estimated based on air concentrations:

- soil;
- soil pore water;
- indoor air and dusts;
- wildlife game (deer, ruffed grouse); and
- local agricultural foods (beef, dairy, poultry).

Many of the equations and assumptions used to predict environmental media concentrations were provided by the U.S. EPA OSW (2005). In addition to providing the equations and algorithms used to estimate environmental media concentrations, the following sections provide the methods used to estimate human chemical exposures, and to predict risks.

Maximum annual average ground level air concentrations were predicted at several human receptor locations identified in the Problem Formulation of the main report. These locations were divided into different groups in association with receptor type: agricultural (AGR), residential (RES), industrial/commercial (IND), public use areas (PUA) such as parks, monitoring stations (monitoring) representing predicted concentrations at these stations in the future, and fence line receptors that may be located on or near the StatoilHydro property boundary on a short-term basis.

The assessment of inhalation exposures alone (acute and chronic) involved the use of the maximum predicted air concentrations for each receptor group. The maximum predicted air concentrations for the agricultural receptor group were used to predict the concentrations of COPCs in agricultural foods. Wild game concentrations were based upon the highest predicted concentrations in the tissues out of the agricultural, residential, public use area, and monitoring receptors for all COPCs.

In order to facilitate understanding of the calculations and methods used to estimate exposures and risks, the model description provides a worked example for adult exposure to aliphatic C9-C16 in the application case.

2.1 Concentrations in Soil

2.1.1 Background Soil Concentrations

Soil sampling was conducted from within the study area to determine the current background conditions. Six sampling locations were selected. The findings of this sampling are presented in the table below for the COPCs only (results for other substances have been omitted from this Appendix, and are provided in [Appendix 4D](#) of the original HHRA).

2.1.2 Predicted Soil Concentrations

Predicted chemical concentrations in soil were based on predicted maximum annual average ground level air concentrations. Soil concentrations were estimated by applying deposition rates to air quality modeling results, and then calculating soil concentrations based on equations described below. Predicted soil concentrations were presented in [Appendix 4E](#).

2.1.2.1 Background Deposition

Atmospheric deposition of organic and inorganic chemicals occurs in two modes: wet and dry deposition (Golomb et al., 1997). In wet deposition, aerosols and gases are dissolved or suspended in precipitation: rain, snow, hail, fog and mist. Dry deposition of particles occurs by direct impaction and gravitational settling on land or water surfaces.

Calculating the Wet Vapour Deposition Velocity:

$$V_{wvd} = P_a \times SR \times CF$$

Where:

V_{wvd}	=	velocity of wet vapour deposition [m/s]
P_a	=	annual precipitation rate [m/year]
SR	=	scavenging ratio [200,000 unitless]
CF	=	conversion factor from years to seconds [3.1709979E-08 year/s]

The scavenging ratio represents the ratio between the volume of air a typical raindrop will sweep through as it falls to the earth relative to the volume of the rain drop. Therefore, a typical raindrop will fall through a volume equal to 200,000 (Mackay, 1991) times its volume prior to landing on land or water. Canadian climate “normals” recorded at Fort Saskatchewan, Alberta between 1971 and 2000 provides a precipitation rate of 459.5 mm/year (Environment Canada, 2007). Using this value the wet deposition velocity is estimated to be 0.003 m/s. The human health risk assessment assumed a wet deposition velocity of 0.004 m/s which is conservative and consistent with previous assessments.

Converting the Air Concentration to a Deposition Rate

Combining the predicted ground level air concentration with the wet vapour deposition velocity will yield the loading rate of chemical to soil.

$$D = C_a \times VP_f \times V \times CF1 \times CF2$$

Where:

- D = vapour or particulate deposition rate [mg/m²/year]
- C_a = concentration in air [ug/m³]
- VP_f = vapour or particulate phase fraction [%]
- V = vapour or particulate phase deposition velocity [m/s]
- CF1 = conversion factor 3.1536E+07 [s/year]
- CF2 = conversion factor 0.001 [mg/ug]

- Wet vapour deposition (D_{wv})
- Wet particle deposition (D_{wp})
- Dry vapour deposition (D_{dv})
- Dry particle deposition (D_{dp})
- D_{wv} = 37.7 = 0.299 × 100% × 0.004 × 3.1536E+07 × 0.001
- D_{wp} = 0 = 0.299 × 0% × 0.004 × 3.1536E+07 × 0.001
- D_{dv} = 94.3 = 0.299 × 100% × 0.01 × 3.1536E+07 × 0.001
- D_{dp} = 0 = 0.299 × 0% × 0.03 × 3.1536E+07 × 0.001
- Total deposition = 132 = 37.7 + 0 + 94.3 + 0

2.1.2.2 Calculating Chemical Loss Constants

There are several processes by which chemical concentrations may be reduced in soil through losses. These processes may or may not occur simultaneously. The total rate at which a chemical is lost from soil was designated as k_s . There are five mechanisms by which compounds may be lost from soil: leaching, runoff, erosion, biotic and abiotic degradation, and volatilization. Only abiotic and biotic degradation and volatilization processes were considered for PAHs and VOCs in this assessment.

Chemical Loss via Biotic and Abiotic Degradation

The degradation rate can be calculated as follows if the soil half-life ($t_{1/2}$) is known:

$$k_{sg} = \frac{0.693}{t_{1/2}}$$

For organics, soil half-life values for abiotic and biotic degradation were obtained from U.S. EPA OSW 2005; Howard *et al.* 1991; and Mackay *et al.* 1992.

$$K_{sg} = 0.145$$

Chemical Loss via Volatilization

The $t_{1/2}$ can also be predicted with established relationships between vapour pressure, water solubility, and soil adsorption coefficient as follows (Swan *et al.* 1979):

$$t_{1/2} = 1.58 \times 10^{-8} \left(\frac{K_{oc} S}{P_{vp}} \right) \text{ days}$$

Where:

- $t_{1/2}$ = soil half-life (volatilization) [days]
- K_{oc} = soil sorption coefficient [(ug/g) / (ug/mL)]
- S = water solubility [mg/L]
- P_{vp} = vapour pressure [mm Hg]

$$t_{1/2} = 0.208 = 1.58 \times 10^{-8} \times \left(\frac{631000000 \times 7.6E - 04}{0.0365} \right)$$

The half-life is then converted to a rate constant using the following equation:

$$k_{sv} = \frac{0.693}{t_{1/2} / CF}$$

Where:

- K_{sv} = volatilization loss rate [years⁻¹]
- $t_{1/2}$ = volatilization half life [days]
- CF = conversion factor [365 days/year]

$$k_{sv} = 1217 = \frac{0.693}{0.208 / 365}$$

Total Soil Loss Constant

$$k_s = k_{sg} + k_{sv}$$

Where:

- k_s = chemical-specific soil loss constant due to all processes (year⁻¹)
- k_{sg} = chemical-specific soil loss constant due abiotic and biotic degradation (year⁻¹)
- k_{sv} = chemical-specific soil loss constant due to volatilization (year⁻¹)

$$k_s = 1217 = 0.145 + 1217$$

2.1.2.3 Calculating the Deposition Term and Predicted Soil Concentration

The following illustrates the methodology used to derive soil concentrations on a mass per mass basis (ug/g), given the appropriate air dispersion data. Deposition to soil was calculated using the following equation:

$$D_s = \frac{(D_{dp} + D_{wp} + D_{dv} + D_{wv})}{Z_s \times BD}$$

Where:

- D_s = chemical-specific deposition (mg of chemical /kg of soil/year)
- D_{dp} = chemical-specific dry particle deposition rate (mg/m²/year)
- D_{wp} = chemical-specific wet particle deposition rate (mg/m²/year)
- D_{dv} = chemical-specific dry vapour deposition rate (mg/m²/year)
- D_{wv} = chemical-specific wet vapour deposition rate (mg/m²/year)
- Z_s = soil mixing zone depth (m)
- BD = soil bulk density (kg soil/m³ soil)

$$D_s = 0.31 = \frac{132}{0.2 \times 1500}$$

$$C_s = \frac{D_s \times [1 - \exp(-ks \times tD)]}{ks}$$

Where:

- C_s = average soil concentration over exposure duration (mg/kg soil)
- D_s = deposition term (mg of chemical/kg soil/year for untilled and tilled soils, respectively)
- ks = chemical soil loss constant due to all processes (year⁻¹)
- tD = time period over which deposition occurs (years)

$$C_s = 2.5 \times 10^{-4} = \frac{0.31 \times [1 - \exp(-1217 \times 75)]}{1217}$$

2.1.3 Surface Water Concentrations

All measured surface water concentrations for PAHs available from recent assessments in the area (PC 2006) were less than analytical detection limits. Due to the lack of a reliable data set of detectable values, surface water concentrations as they relate to plants and animals were predicted from airborne deposition to soil and subsequent runoff.

Predicted Surface Water Concentrations

$$C_w = C_s \times (BD / (P_w + (K_d * BD) + H * P_a))$$

Where:

C_w = concentration in runoff
 P_w = moisture filled porosity for fine soils (0.168, dimensionless) from AENV 2006
 P_a = vapour filled porosity for fine soils (0.32, dimensionless) from AENV 2006
 K_d = soil to water partition coefficient from AENV 2006 and CCME 2006
 BD = soil bulk density (1500 kg/m³) from AENV 2006
 H = unitless Henry's constant

$$4.0E - 11 = 0.00025 \times \left(\frac{1500}{0.168 + 6310000 \times 1500 + 80 \times 0.32} \right)$$

Due to the effect of dilution in the movement of surface water to a surface water body, C_w is assumed to be diluted by a factor of 10.

$$C_{sw} = C_w / DF$$

Where,

C_w = concentration in runoff
DF = dilution factor (10, unitless).
 $4.0E-12 = 4.0E-11 / 10$

2.1.4 Plant Concentrations

2.1.4.1 Background Plant Concentrations

Please refer to [Appendix 4D](#) Background conditions of the original HHRA for information regarding the plant sampling program.

2.1.4.2 Predicted Plant Concentrations

The uptake of chemicals into vegetation (i.e., root vegetables, leafy vegetables, forage, grain and fruit) is a topic that has been extensively reviewed in the literature. Chemical emissions to the atmosphere may be taken up by vegetation from three sources: particulate in air (dust or aerosols); vapours in air (gases); and, subsurface compartments (soil, water) (Rolfe 1972; Baes 1982; Travis and Hattemer-Frey 1988; Boon and Sultanpour 1992; Muller et al. 1993; Schroll and Scheunert 1993; McCrady and Maggard 1993). The magnitude of uptake from these sources has been correlated with physical/chemical parameters (vapour pressure, octanol water partition coefficient, etc.), soil parameters (fraction of organic carbon, soil moisture, clay content, etc.), plant parameters (lipid content, moisture content, etc.) and with chemical concentrations in air and other environmental media (U.S. EPA OSW 2005).

The methodology used to estimate the contribution from each route of chemical uptake in vegetation is described in the following sections. Predicted plant tissue concentrations are presented in [Appendix 4D](#) of the original HHRA based on the

maximum air concentration predicted for each chemical out of the agricultural, residential, public use and monitoring locations. All of these receptor location groups were considered, as it is feasible that larger animals may graze in various locations within the area over a lifetime.

The following sources of chemical uptake into the tissues of plants were considered, and are described in detail below:

- Direct deposition of particles onto plant produce;
- Air to aboveground plant produce (vapour transfer to leaves / foliage);
- Soil to aboveground plant produce; and
- Soil to belowground plant produce.

2.1.5 Plant Chemical Concentration Due to Direct Deposition

Atmospheric deposition was only considered for plants whose edible portions are above the ground and where the chemical potentially exists in particulate form. The following equations were used to predict produce concentration due to direct wet and dry deposition processes.

$$Pd = \frac{0.001 \times [Ddp + (Fw \times Dwp)] \times Rp \times [1.0 - \exp(-kp \times Tp)]}{Yp \times kp}$$

Where:

- Pd = plant (aboveground produce) concentration due to direct (wet and dry) deposition (mg of chemical/ kg DW)
 Ddp = yearly average dry deposition from particle phase (ug/m²/year)
 Dwp = yearly average wet deposition from particle phase (ug/m²/year)
 0.001 = mg/ug conversion factor
 Rp = intercept fraction of edible portions of plant (unitless)
 kp = plant surface loss coefficient (year⁻¹)
 Tp = length of plant exposure to deposition per harvest of the edible portion of the *i*th plant group (unitless)
 Yp = crop yield or productivity (kg DW(dry weight)/m²)
 Fw = fraction of chemical wet deposition that adheres to plant (unitless; 0.2 for anions and 0.6 for cations and most organics recommended; used 0.6)

$$Pd = 0 = \frac{0.001 \times [0 + (0.6 \times 0)] \times 0.39 \times [1 - \exp(-18 \times 0.16)]}{2.24 \times 18}$$

Intercept Fraction

The U.S. EPA OSW recommends the use of the default Rp value since it represents the most current information available with respect to productivity and relative ingestion

rates. Experimental studies as summarized by Baes et al. (1984), suggested a correlation between interception fractions and productivity (standing crop biomass (Yp) Chamberlain 1970):

$$R_p = 1 - e^{-\gamma Y_p}$$

Where:

- Rp = intercept fraction of the edible portion of the plant (unitless)
- e = empirical constant Chamberlain (1970) presents a range of 2.3 to 3.3
- Yp = yield or standing crop biomass (productivity) (kg WW/m²)

Initially, Baes et al. (1984) developed intercept fractions values for three classes of vegetation (vegetables, silage and exposed produce). These intercept fractions were independent of plant specific crop yields and as a result led to surface plant concentration predictions that were unreasonable. Baes et al. (1984) used an empirical constant developed by Chamberlain (1970), which was then used to generate class-specific empirical constants (e). The U.S. EPA (1994c) and U.S. EPA (1995b) proposed a default aboveground Rp value of 0.05. These values were weighted by relative ingestion of each class to derive a weighted average. The relative ingestion rates used by U.S. EPA (1994c) and U.S. EPA (1995b) were not consistent with the Exposure Factors Handbook (U.S. EPA 1997), and therefore the suggested value of 0.05 is no longer used. As a result, produce classes were combined into two groups - exposed fruit and exposed vegetables. The exposed produce constant (e) of 0.0324 developed by Baes et al. (1984) was used to estimate an Rp value. As the exposed produce category includes leafy vegetables and fruiting vegetables, Rp was calculated for both leafy and fruiting vegetables. For exposed vegetables, Rp was determined by a weighted average of the crop yields of leafy and fruiting vegetables. Relative ingestion rates from the Exposure Factors Handbook (U.S. EPA 1997) were then used to derive a weighted Rp value 0.39 for garden produce and 0.5 for forage (U.S. EPA OSW 2005).

Plant Surface Loss Coefficient

The U.S. EPA (1990) identified several processes that contributed to the loss of contaminants on vegetative surfaces. The three mechanisms of removal considered included wind removal, water removal and growth dilution. These three mechanisms or processes contribute to the reduction of contaminant that has deposited on vegetative surfaces. The kp value is a measure of the amount of contaminant loss due to these three mechanisms. Miller and Hoffman (1983) used the following relationship to relate half-life times to kp values.

$$k_p = (\ln 2 / t_{1/2}) \times 365 \text{ days / year}$$

Where:

- t_{1/2} = half-life (days)

Miller and Hoffman (1983) reported half-life values of 2.8 to 34 days for a number of different chemicals on vegetative surfaces, which resulted in kp values of 7.44 to 90.36 (year^{-1}). As a result, the U.S. EPA (1993), U.S. EPA (1994a) and the U.S. EPA OSW (2005) recommend a default kp value of 18, which corresponds to a 14 day half-life.

Growing Season or Length of Plant Exposure per Year

Belcher and Travis (1989) estimated that forage crops are exposed on average approximately 60 days during the growing season, before harvest. U.S. EPA (1990), U.S. EPA (1993) and the NC DEHNR (1997) recommend a value of 60 days or 0.164 years. Similar assumptions were made for the growing season of garden produce.

Yield or Standing Crop Biomass or Productivity

The U.S. EPA OSW (2005) recommends using a value of 0.24 kg DW/m² for forage and 2.24 kg DW/m² for garden produce. Based on a review of recent literature, these values appeared to be the most appropriate. The following equation is used to estimate the forage or crop yield:

$$Yp = \frac{Yh_i}{Ah_i}$$

Where:

Yp = yield (kg/ DW/m²)
 Yh_i = harvest yield of the i^{th} crop (kg DW)
 Ah_i = area planted to the i^{th} crop (m²)

Fraction of Chemical that Adheres to Plant Surfaces

The U.S. EPA OSW (2005) recommends using the chemical class-specific values of 0.2 for anions and 0.6 for cationic compounds. This parameter describes the fraction of wet deposition that would adhere to plant surfaces.

Empirical Correction Factor

Lipophilic compounds (*i.e.*, those compounds with Log K_{ow} greater than 4) are generally not able to pass through the skin to the inner portions of bulky produce as easily as those compounds which tend to be more water soluble (*i.e.*, with Log K_{ow} less than 4). Therefore the U.S. EPA OSW (2005) recommends using an empirical constant of 0.01 for those compounds considered more lipophilic (*i.e.*, Log K_{ow} greater than 4) and a constant of 1 for those with Log K_{ow} less than 4.

2.1.6 The Air-to-Plant Biotransfer Factor for Aboveground Produce

The air-to-plant biotransfer factor (Bv) can be defined as the ratio of chemical in aboveground plant parts to the concentration of chemical in ground-level air (U.S. EPA OSW 2005). According to the U.S. EPA (1995a), root vegetables are protected from this mechanism of uptake. For all organic chemicals, the air-to-plant transfer factors were based on work with azalea leaves by Bacci *et al.* (1990 and 1992).

The following equation was used to calculate aboveground plant tissue concentrations:

$$P_v = \frac{C_{air} \times B_v \times F_v \times VG_{ag}}{\rho_{air}}$$

Where:

- P_v = COPC concentration in plant (mg/kg dry weight)
- C_{air} = COPC concentration in air ($\mu\text{g}/\text{m}^3$)
- B_v = mass-based air-to-plant biotransfer factor ($\mu\text{g}/\text{g}$ dry-weight plant / $\mu\text{g}/\text{g}$ air)
- ρ_{air} = density of air 1190 g/m³ (Weast 1981)
- F_v = Fraction of chemical in vapour phase
- VG_{ag} = Empirical correction factor for aboveground forage (unitless)

$$1.5E-06 = \frac{0.299 \times 0.61 \times 1 \times 0.01}{1190}$$

After conversion to wet weight and application of washing and peeling factor:

$$2E-07 = 1.5E-06 \times (1-0.85) \times 0.85$$

Conversion to wet weight (WW):

$$P_v (\text{wet weight}) = P_v (\text{dry weight}) \times (1 - MC)$$

Where:

- MC = fraction of plant that is water (0.85; McCrady and Maggard, 1993)

Studies based on the Welsch-Pausch et al. (1995) experiments, as by Lorber (1995), suggested a factor of 100 be applied to all biotransfer factors for organics estimated using the Bacci et al. (1992) methodology.

The following equation was derived by Bacci et al. (1992) and is based on the evaluation of 14 different compounds to develop a relationship with K_{ow} and Henry's Law.

$$\log B_{vol} = 1.065 \log K_{ow} - \log \left(\frac{H}{RT} \right) - 1.654$$

Where:

- B_{vol} = volumetric air-to-plant biotransfer factor (fresh-weight basis)
- $\log K_{ow}$ = log of the octanol-water partition coefficient (unitless)
- H = Henry's Law constant of the compound ($\text{atm m}^3/\text{mol}$)
- T = room temperature in Kelvin (293 K)
- R = gas constant ($8.207E-05 \text{ atm m}^3/\text{K mol}$)

$$\log B_{vol} = 3.77 = 1.065 \times 6.91 - \log\left(\frac{1.9}{0.000082 \times 288}\right) - 1.654$$

The mass based air-to-plant biotransfer factor is calculated with the following equation:

$$B_v = \frac{\rho_{air} \times B_{vol} / RF}{(1 - f_{water}) \times \rho_{forage}}$$

Where:

- B_v = mass-based air-to-plant biotransfer factor (ug/g dry-weight plant / ug/g air)
- RF = reduction factor (100 for organics; U.S. EPA OSW 2005)
- ρ_{air} = density of air 1.19 g/L (Weast 1981)
- ρ_{forage} = 770 g/L (McCrary and Maggard 1993) density of forage
- f_{water} = 0.85 (fraction of forage that is water; McCrary and Maggard 1993)

$$B_v = 0.61 = \frac{1.19 \times 5966 / 100}{(1 - 0.85) \times 770}$$

2.1.7 Above and Below Ground Vegetation Concentrations

Contaminants present in soil may be taken up into edible portions of above and belowground plants. As a result, two methods of predicting contaminated concentration in edible plant concentrations have been recommended by the U.S. EPA OSW (2005). These methods are consistent with other U.S. EPA guidance documents (U.S. EPA 1994b; U.S. EPA 1994c; and U.S. EPA 1995b).

Aboveground Plants

$$Pr = (Cs \times Br_{ag}) \times (1 - MC)$$

Where:

- Pr = contaminant concentration in produce as a result of root uptake (mg/kg)
- Cs = tilled soil concentration (mg/kg soil)
- Br_{ag} = plant-soil bioconcentration factor for aboveground produce (unitless; calculated below for organics)
- MC = 0.85 (fraction of forage that is water; McCrary and Maggard 1993)

$$Pr = 1.5E-07 = (2.5E-04 \times 0.004) \times (1 - 0.85)$$

A substantial amount of empirical data available in the literature demonstrates there is significant uptake of organics into plants. Organic chemicals in soils were reported to be

taken up by vegetation (i.e., carrots, tomatoes, potatoes and narcissus) through the roots (Iwata and Gunther 1976; Cocucci *et al.* 1979; Bacci and Gaggi 1985; Travis and Arms 1988; Schroll and Scheunert 1993). Travis and Arms (1988) reported that uptake of organic chemicals by vegetation is correlated to octanol-water partition coefficients (K_{ow}).

The method of Travis and Arms (1988), as modified by Travis and Blaylock (1992), was used to estimate the bioconcentration of organic chemicals from soil to vegetation *via* root uptake. This method was based on measured data that demonstrated that the bioconcentration factor for an organic chemical in vegetation is inversely proportional to the square root of the octanol-water partition coefficient (K_{ow}). Root uptake of organics has been correlated with K_{ow} and has been shown to decrease as K_{ow} increases (Briggs *et al.* 1982; in Travis and Blaylock 1992). A geometric mean regression analysis of data for 29 different organic chemicals demonstrated a relationship between bioconcentration factors in vegetation and octanol-water partition coefficients ($r = 0.73$) (Travis and Arms 1988). The first step of the method of Travis and Arms (1988), as modified by Travis and Blaylock (1992), is to calculate a chemical-specific bioconcentration factor for vegetation. The bioconcentration factor for aboveground vegetation (Br_{ag}) is defined as the ratio of the concentration in the plant (ug of chemical/g of dry plant) to the concentration of the chemical in the soil (ug of chemical/g of dry soil). The Br_{ag} can be calculated for organic chemicals according to the formula:

For organics only:

$$Br_{ag} = 38.73K_{ow}^{-0.578}$$

2.1.8 Belowground Produce

Belowground produce refers to all root-vegetables and therefore concentrations derived using this methodology would only be applied to root-vegetable consumption rates.

$$Pr_{bg} = (Cs \times Br_{rootveg} \times Vg_{root}) \times (1 - MC)$$

Where:

- Pr_{bg} = contaminant concentration in belowground produce as a result of root uptake (mg/kg)
- Cs = soil concentration (mg/kg soil)
- $Br_{rootveg}$ = plant-soil bioconcentration factor for belowground produce (unitless; calculated below for organics only)
- Vg_{root} = empirical correction factor for belowground produce (1; unitless)
- MC = 0.85 (fraction of forage that is water; McCrady and Maggard 1993)

$Pr_{bg} = 3.8E-10 = (2.5E-04 \times 0.001 \times 0.01) \times (1-0.85)$
--

Vg_{root} is dependant on the lipophilic nature of the chemical of concern. For compounds with a Log K_{ow} greater than 4, an empirical correction factor of 0.01 was assigned and for compounds with a Log K_{ow} less than 4, a value of 1.0 was applied.

Where the plant-soil bioconcentration factor for belowground produce is as follows:

$$Br_{rootveg} = \frac{RCF}{Kd_s}$$

$$Br_{rootveg} = 0.001 = 6322 / 6310000$$

The root concentration factor (RCF) for organic compounds has been obtained from Briggs et al., 1982.

The following equation estimates a RCF value in fresh weight. The following equation must be adjusted to a dry weight basis using a moisture content of 85 percent in root vegetables (Pennington 1994). This relationship is recommended by other regulatory documents such as U.S. EPA (1994a).

$$\text{Log}(RCF - 0.85) = 0.77 \text{Log}K_{ow} - 1.52$$

$$RCF = 6322 = 10^{(0.77 \times \log(8130000) - 1.52)}$$

The soil-water partitioning coefficient (Kd_s) describes the partitioning of a chemical between soil pore-water and soil particles. For organics, Kd_s has been defined by the following equation:

$$Kd_s = K_{oc} \times f_{oc,s}$$

Where:

- K_{oc} = soil organic carbon-water partition coefficient (mL/g)
- $f_{oc,s}$ = fraction organic carbon in soil (U.S. EPA OSW 1998)

$$Kd_s = 6310000 = 631000000 \times 0.01$$

2.1.9 Tissue Concentrations in Livestock and Game

2.1.9.1 Predicted Tissue Concentrations

Livestock (i.e., cattle and chickens) and wild game (i.e., deer and ruffed grouse) tissue concentrations were calculated following the U.S. EPA OSW (2005) methodology. For the purpose of estimating tissue residue levels, animals were assumed to be exposed to chemicals through consumption of potentially impacted soil, water and food. Measured

background data was used for soil, forage and surface water where possible for the background case.

Estimated soil and forage concentrations were based on a similar methodology to that used for predicting soil and plant concentrations as described previously. Chemical concentrations in drinking water for the livestock and wild game were predicted based on measured surface water concentrations. In addition, atmospheric deposition of the COPCs to soils and subsequent runoff to a small water body (i.e., dugout or lagoon) was incorporated in the estimation of chemical concentration in drinking water. Atmospheric deposition was not included in the predicted COPC concentrations in drinking water for chickens as drinking water is typically supplied via indoor water troughs.

Predicted livestock and wild game tissue concentrations are listed in Appendix 4C. Livestock tissue concentrations were based on maximum predicted air concentrations of the agricultural receptor locations, whereas the maximum predicted air concentrations of the agricultural, residential, public use area, and monitoring receptor locations were used to predict wild game tissue concentrations.

The following equations were used to calculate the total daily dose of a chemical for an animal via the ingestion of soil, food and water, as well as the inhalation of air. Biotransfer factors (BTF) have been included based on the U.S. EPA OSW (2005) to translate the estimated daily dose of a chemical (mg of chemical/day) from the various environmental media to a tissue concentration for each persistent and bioaccumulative COPC. When empirical data are lacking, one of the most widely used approaches is the regression model developed by Travis and Arms (1988), however these regressions are hampered by the limited log K_{ow} range and questions surrounding the validity of the underlying biotransfer data set. New biotransfer models have been developed (RTI 2005) and incorporated within the assessment as recommended by the U.S. EPA OSW (2005). The following equation was developed to predict the transfer rate of chemical intake into fat tissue. The fat tissue concentration is converted to a tissue concentration based on the fat content of the desired tissue (i.e., muscle or milk).

2.1.9.2 Determination of Biotransfer Factors

$$\log(BTF) = -0.099 \times \log(K_{ow})^2 + 1.07 \times \log(K_{ow}) - 3.56$$

Where:

BTF = biotransfer factor ([mg/kg-fat] / [mg/day])
 K_{ow} = octanol water coefficient

$$0.128 = -0.099 \times \log(8130000)^2 + 1.01 \times \log(8130000) - 3.56$$

The BTF was adjusted to account for the fat content of milk or muscle. Meat fat content was assumed to be 10%. The BTF equation is appropriate for organic chemicals lacking empirical biotransfer data and having a log K_{ow} between -0.67 and 8.2.

The BTF was adjusted to account for the amount of fat in the tissue based on the following equation:

$$BTF_a = BTF \times FC \times MF$$

Where:

- BTF_a = adjusted BTF for fat content of tissue ([mg/kg-tissue] / [mg/day])
- BTF = biotransfer factor ([mg/kg-fat] / [mg/day])
- FC = fat content of tissue (%)
- MF = metabolizing factor (0.01, Hofelt et al.)

$$0.0243 = 0.128 \times 0.19 \times 1.0$$

2.1.9.3 Determination of Game Meat Concentrations

Chemical concentrations in game meat were then predicted based on the following equation:

$$C_{animal} = BTF_a \times \sum (C_{Pi} \times P_{Pi} \times F_{Pi} \times FIR) + (C_{soil} \times SIR \times P_{Soil}) + (C_{water} \times WIR)$$

Where:

- C_{animal} = chemical concentration in animal (mg/kg)
- BTF_a = adjusted BTF for fat content of tissue ([mg/kg-tissue] / [mg/day])
- C_{Pi} = COPC concentration in *i*th plant food item (mg/kg)
- P_{Pi} = proportion of *i*th plant food item in diet that is contaminated (unitless)
- F_{Pi} = fraction of diet consisting of *i*th plant food item (unitless)
- FIR = food ingestion rate (kg/day)
- C_{soil} = COPC concentration in soil (mg/kg)
- SIR = soil ingestion rate (kg/day)
- P_{soil} = proportion of soil in diet that is contaminated (unitless)
- C_{water} = COPC concentration in water (calculated below) (mg/L)
- WIR = water ingestion rate (L/day)

$$C_{animal} = 9.1E-05 = 0.0243 \times ((1.6E-04 \times 100\% \times 100\% \times 11.8) + (3.6E-04 \times 0.5 \times 100\%) + (5.7E-12 \times 37.9))$$

2.2 Calculation of Breast Milk Biotransfer Factor

The potential health effects associated with the ingestion of chemical-impacted breast milk by nursing infants was considered in the current assessment. COPCs with the tendency to bio-accumulate were assessed for the infant's exposure to the mother's milk. The maximum fraction of each COPC expected to bioaccumulate was calculated using the following approach (example given for naphthalene):

$$BM_{BTF} = 2.0E-07 \times K_{ow} \text{ (McKone 1992)}$$

Where:

- BM_{BTF} = breast milk biotransfer factor ([ug/kg milk]/[ug/day intake])
- K_{ow} = octanol-water partition coefficient

$$BM_{BTF} = 1.6 = 2.0E-07 \times 8130000$$

2.2.1 Calculation of Chemical Concentration in Breast Milk

$$CBM = \frac{EXP_{mother} \times BW_{mother} \times BM_{BTF}}{1000}$$

Where:

- CBM = chemical concentration in breast milk (ug/g milk)
- EXP_{mother} = mother's total daily exposure to chemical *via* all routes (ug/kg/day)
- BW_{mother} = mother's body weight (kg)
- BM_{BTF} = breast milk biotransfer factor (ug/kg milk)/(ug/day intake)
- 1000 = unit conversion factor (g/kg)

$$CBM = 0.0039 = \frac{0.034 \times 70.9 \times 1.6}{1000}$$

2.2.2 Air Concentrations

Background air concentrations were included for predicting total exposures to the COPCs, including indoor air concentrations. As described in the main report, existing air concentrations for all discrete receptor locations were predicted in the Air Quality team, and were used to represent background outdoor air concentrations in this assessment. For indoor air, preference was given to background data from the region where possible. In the event that such data was not available, urban Canadian data was applied as necessary.

Acute background air concentrations were not evaluated within this assessment, as the available data represented sampling periods over a number of days. Thus, maximum, median or mean indoor and outdoor air concentrations were evaluated within the chronic assessment only as appropriate.

2.3 Drinking Water Concentrations

Measured PAH and metal concentrations for some of the COPCs were available. [Table 2.3-1](#) below summarizes the measured concentrations collected by StatoilHydro and the concentrations used in the exposure model.

Table 2.3-1 Summary of Measured Groundwater Concentrations of PAHs and Metals

COPC	Measured Groundwater Concentration	Assumed Groundwater Concentration in Model (mg/L)
PAHs and Non-Metals		
aliphatic C ₅ -C ₈ Group	ND	0
aliphatic C ₉ -C ₁₆ Group	ND	0

COPC	Measured Groundwater Concentration	Assumed Groundwater Concentration in Model (mg/L)
aliphatic C ₁₇ -C ₃₄ group	ND	0

zinc	0.08	0.08

All substances that were below analytical detection limits in groundwater were assumed to be zero in the multiple-exposure pathway model. To assume one-half the analytical detection limit to represent the concentrations to which people might be exposed over a lifetime is not scientifically defensible given the range of concentrations (0 to the detection limit, ranging over orders of magnitude) at which a substance may actually be present.

2.4 Fish Concentrations

2.4.1 Background Fish Concentrations

Measured data from the area for both fish tissue and surface water were evaluated to determine the most representative background fish tissue concentrations for the multi-pathway assessment. Surface water concentrations and fish tissue concentrations of the COPCs were all determined to be below analytical detection limits in other assessments completed recently in the area (PC 2006). As there is no reliable, measured data available, fish consumption was not considered in the HHRA.

Measured PAH concentrations in fish obtained from the North Saskatchewan River near the study area was conducted by PCOSI (2007). This data is summarized below in [Table 2.4-1](#). As all measurements were below analytical detection limits, the assumed fish tissue concentration of PAHs were all assumed to be zero (please refer to the discussion for groundwater above).

Table 2.4-1 Summary of Measured Fish Tissue Concentrations of PAHs

PAHs	Measured Concentration (mg/kg ww), PC 2007	Assumed Concentration for HHRA (mg/kg ww)
anthracene	0.05	0
benzo(a)anthracene	0.05	0
benzo(a)pyrene	0.05	0
benzo(a)pyrene	0.05	0
Benzo(b)fluoranthene	0.05	0
benzo(e)pyrene	0.05	0
benzo(ghi)perylene	0.05	0

naphthalene	0.05	0
benzo(a)pyrene	0.05	0
phenanthrene	0.05	0
pyrene	0.05	0

PAHs in water and fish samples taken from the Ft. Saskatchewan area have presented PAH concentrations consistently below analytical detection limits (PC 2007, Shell 2007). In addition, surface water concentrations of PAHs in the NSR have also been reported to be below analytical detection limits (PC 2007). Thus, it is reasonable to conclude that water and fish pathways are not significant sources of PAH exposure to the general population. PAH compounds are not anticipated to be released via water pathways and changes in water quality are not anticipated.

2.4.2 Predicted Fish Concentrations

As no impacts on water quality or fish health were anticipated in association with the Project, the change in fish concentrations from background were assumed to be zero for the PAH compounds.

Fish concentrations of metals were determined from measured or predicted surface water concentrations and bioconcentration factors (BCFs). [Table 2.4-2](#) below presents a summary of the measured surface water concentrations for metals, as provided in the impact assessment section of the Water Quality report within the original EIA.

Table 2.4-2 Summary of Measured Surface Water Concentrations in the North Saskatchewan River

Metals	Measured Concentration in North Saskatchewan River (mg/L)	Predicted Concentration 1.29 km downstream (mg/L)
Aluminum	0.073	0.0747
Antimony	ND	ND
Arsenic	ND	ND
Barium	NA	ND
Beryllium	0.0001	0.0001

Tin	NA	ND
Uranium	NA	ND
Vanadium	ND	0.00002
Zinc	0.008	0.0082

NR: Not anticipated to be released by Project.

ND: Not detected. Concentration assumed to be zero.

2.5 Conversion from Dry Weight to Wet Weight

The current methodology estimates vegetation concentrations on a dry weight basis. Since home-grown produce will be consumed on a fresh weight basis, dry weight concentration estimates were converted to a fresh (or wet) weight basis. A moisture content of 85% was used to represent average moisture content of vegetation. The following equation was used to estimate media concentrations on a fresh (or wet) weight basis:

$$\left(\text{Wet Weight Conc.} \right) = \left(\text{Dry Weight Conc.} \right) \times \left(1 - \frac{\text{moisture content}}{100} \right)$$

2.6 Human Receptor Characteristics

2.6.1 Receptor Selection

Air quality predictions were available for over 500 receptor locations. These locations were divided into receptor groups based upon location and potential receptor characteristics.

The receptors that have the highest likelihood of being adversely affected by the COPCs are included in the assessment to represent estimates of reasonable maximum exposure.

The rationale behind this approach is that, if health risks are not identified for highly exposed and susceptible individuals, risks are also likely to be negligible in individuals who received a lower degree of exposure, or who may be less susceptible to the effects of the COPCs. The distinction between the receptor types is necessary, as food consumption patterns and behaviours (e.g. time spent at the site) varies between the groups of people evaluated.

The HHRA for this Project evaluated the potential for adverse health effects to occur in association the Project emissions in individuals who reside in the area 24-hours/day, 7-days/week, 52-weeks/year, as well as those who may work at industrial/commercial locations, or may use public recreational areas within the study area.

Six hypothetical receptor types were included in the HHRA:

- **Agricultural Receptor (AGR):** Includes receptors in the area who live in agricultural areas, and are assumed to obtained 100% of their game, fish, fruit and vegetables from local sources. Agricultural food products such as beef, eggs, poultry and dairy were also included in the assessment for the agricultural receptor, as it is feasible that local products may be consumed on a regular basis. It was assumed these receptors live in the area over a lifetime, and are exposed to air, dusts, drinking water, and local foods. All receptor locations that were agricultural in nature within a 4 km radius of the Project were included in this group. In the event that it was not evident whether an active agricultural operation was present at the site, or whether individuals live at the site, it was conservatively assumed that these receptor locations were part of the agricultural group.
- **Residential Receptor (RES):** This group includes receptors who reside in nearby communities. These individuals are assumed to consume some local game meats and garden produce, but the majority of their diet is from non-local sources (e.g. supermarket foods). It was assumed these receptors live in the area over a lifetime, and are exposed to vapours, dusts, drinking water, and local foods.

- **Industrial/Commercial (IND):** Individuals who may work at industrial/commercial sites within the study area, but do not consume local foods on a regular basis over a lifetime (if the workers are local, the assumptions in the agricultural and residential scenarios above would apply). It is also assumed that these receptors are exposed over a lifetime to vapours and dusts.
- **Public Use Area (PUA):** Receptors who visit the area for recreational purposes on an occasional basis during the year. This receptor group includes areas such as parks, campgrounds etc. within the area. Inhalation exposure is evaluated for this
- **Monitoring Stations (MON):** Several air quality monitoring stations are within the study area, and have been included in this assessment in order to evaluate the potential for health effects at the monitoring site locations in the future.
- **Fenceline:** Air concentrations at the edge of the NAOSC lease boundary were evaluated to represent a reasonable estimate of maximum concentrations to which transient receptors may be exposed to on a short-term basis.

The agricultural and residential receptor groups both represent individuals who reside in the area over a lifetime, with the only distinctions between the two groups being location (urban vs. farm), and the higher consumption rates. All receptor locations within agricultural and rural areas were included in the agricultural group. Residents of nearby communities with developed residential areas (Bon Accord, Bruderheim, Gibbons, Josephburg, Lamont, Redwater) were included in the residential receptor group.

Industrial locations within the study area incorporated into the assessment included the properties owned by Degussa Canada., Northwest Upgrading, Providence Energy, Nikoforuk Construction, Provident Energy, Agrium Products, Shell Canada, Value Creations, and Ag-Oil Alberta.

Public Use Areas that were evaluated as part of the assessment included the Bruderheim Natural Area, Astotin Natural Area, Fort Saskatchewan Natural Area, Redwater Natural Area, and Elk Island National Park.

In addition, several monitoring stations (MON) were evaluated. These receptor locations include monitoring stations in various areas (residential, rural and public use areas) including several passive monitoring stations.

A construction worker scenario was not specifically evaluated, given that the HHRA focused on a reasonable maximum exposure that assumed the Project was fully operational. During construction, the Project is not under operation, thus the workers are not exposed to Project emissions. The assessment of the other receptor types (for example, agricultural or residential) involve more conservative exposure estimates, and cover any individual who may live or work within the area (including but not limited to construction workers) given that individuals who consume local water and foods in addition to being exposed to air will have a greater total exposure to the COPCs.

A list of the receptor locations and groups are provided below. The fenceline receptor group was comprised of 327 discrete receptor locations, and the monitoring group consisted of 59 locations. As these groups represent hypothetical receptors, details

regarding their specific locations are not detailed below. A list of the detailed receptor locations is provided in [Appendix 4B](#).

2.6.2 Agricultural (AGR) Receptor

The agricultural receptor is conservatively assumed to obtained 100% of agricultural foods (beef, dairy, poultry, eggs), fruits and vegetables, game (deer and grouse), and fish from local sources. All consumption rates for the agricultural receptor were obtained or derived from Health Canada (2004a), Health Canada (1994), or O'Connor and Richardson (1997). A summary of the consumption rates and general characteristics of the agricultural receptor are presented in [Table 2.6-1](#) below.

Table 2.6-1 Summary of Receptor Characteristics for the Agricultural Receptor

Parameter	Unit	Adult	Adolescent	Child	Toddler	Infant	References
Body weight	kg	70.7	59.7	32.9	16.5	8.2	HC 2004
Inhalation rate	m ³ /d	15.8	15.8	14.5	9.3	2.1	HC 2004
Soil ingestion	g/day	0.02	0.02	0.02	0.08	0.02	HC 2004
Root Vegetables	g/day	188	227	161	105	83	HC 2004
Leafy Vegetables	g/day	137	120	98	67	72	HC 2004
Fruit	g/day	46	56	69	40	5	HC 1994; sum of consumption rates for apples, applesauce, cherries, strawberries, blueberries, jams and honey
Beef	g/day	90	89	53	37	32	HC 1994; sum of consumption rates for steak, roast and stewing beef, ground beef, pork and lamb
Dairy	g/day	297	590	622	677	546	HC 1994; sum of consumption rates for whole mil., 2% milk, skim milk, evaporated milk, cream, ice cream, yogurt, cheese, cottage cheese, processed cheese, butter
Poultry	g/day	21	20	17	13	0	HC 1994; assumed 100% of chicken consumption rate
Eggs	g/day	32	22	21	24	5	HC 1994
White-tailed deer	g/day	90	89	53	37	32	Assumed 100% of beef consumption rate (above)
Grouse	g/day	21	20	17	13	0	Assumed 100% of poultry consumption rate (above)
Breast milk	g/day	0	0	0	0	664	O'Connor and Richardson 1997
Drinking Water	L/day	1.5	1.0	0.8	0.6	0.3	Health Canada 2004
Fish	g/day	40	40	33	20	0	Health Canada 2007; Adjusted using ratio of rates from Health Canada 2004

Skin surface area and soil loading rates were obtained from Health Canada (2004).

2.6.3 Residential (RES) Receptor

Several of the assumptions made for the agricultural receptor were determined to not be as relevant to individuals who do not live on agricultural land and spend most of their time in communities. Food consumption rates were obtained from the same sources as the agricultural receptor, but adjusted to reflect that less locally-sourced food would be consumed and a larger portion of the diet would come from non-local sources (e.g. supermarket items).

The consumption rates and characteristics for the residential receptor are presented in [Table 2.6-2](#) below.

Table 2.6-2 Summary of Receptor Characteristics for the Residential Receptor

Parameter	Unit	Adult	Adolescent	Child	Toddler	Infant	References
Body weight	kg	70.7	59.7	32.9	16.5	8.2	HC 2004
Inhalation rate	m ³ /d	15.8	15.8	14.5	9.3	2.1	HC 2004
Soil ingestion	g/day	0.02	0.02	0.02	0.08	0.02	HC 2004
Root Vegetables	g/day	19	23	16	11	8	HC 2004 adjusted with CCME 1996 factor for proportion of home-grown garden produce consumed
Leafy Vegetables	g/day	14	12	10	7	7	HC 2004 adjusted with CCME 1996 factor for proportion of home-grown garden produce consumed
Fruit	g/day	5	6	7	4	1	HC 1994; HC 2004 adjusted with CCME 1996 factor for proportion of home-grown garden produce consumed
Beef	g/day	--	--	--	--	--	
Dairy	g/day	--	--	--	--	--	
Poultry	g/day	--	--	--	--	--	
Eggs	g/day	--	--	--	--	--	
White-tailed deer	g/day	45	44	26	18	16	Assumed 50% of beef consumption rate (above) for AGR
Grouse	g/day	11	10	8	7	0	Assumed 50% of poultry consumption rate (above) for AGR
Breast milk	g/day	0	0	0	0	664	O'Connor and Richardson 1997
Drinking Water	L/day	1.5	1.0	0.8	0.6	0.3	Health Canada 2004
Fish	g/day	40	40	33	20	0	Health Canada 2007; Adjusted using ratio of rates from Health Canada 2004

2.6.4 Industrial (IND) Receptor

The behaviour patterns of workers at the various industrial facilities in the area are likely to be different than those of the long-term residents. Inhalation pathways, and the dermal contact and dust ingestion exposure pathways were assumed to be relevant to this receptor, while the consumption of local foods and water were not.

The body weights, soil ingestion rate, and inhalation rates for the residential receptors (presented above) were applied for the industrial receptors. Skin surface area and soil loading rates were obtained from Health Canada (2004), as both the dermal and oral pathways were evaluated.

2.6.5 Public Use Area (PUA) Receptor

The public use area receptor was assessed only in relation to the inhalation pathway, as the behaviour characteristics of this receptor type is such that the duration of time that a person would be in the area would be limited, and their exposure to COPCs via the dermal and oral pathways would be negligible. Thus, receptor characteristics for this receptor related to the oral and dermal contact pathways are not provided as for the other receptor types.

2.6.6 Monitoring (MON) Receptor

The monitoring receptor was assessed only in relation to the inhalation pathway. This receptor is hypothetical, as these locations represent monitoring stations in various areas, rather than specific individuals. However, they are of relevance, as existing and future air concentrations of the COPCs are evaluated for these locations. Receptor characteristics for this receptor related to the oral and dermal contact pathways are not provided as for the other receptor types.

2.6.7 Fenceline Receptor

The fenceline receptor was assessed only in relation to the inhalation pathway on an acute basis only. This receptor is intended to represent a transient individual who may be present around the NAOSC site boundary on an occasional basis, for a short-duration of time. Residents are not considered to be a part of this group.

3 EQUATIONS AND ALGORITHMS USED TO ESTIMATE HUMAN EXPOSURE RATES

The following section identifies the algorithms used to estimate human exposure. Similar methods were used to evaluate all receptors, receptor locations, and COPCs.

3.1 Total Exposure from Consumption of Agricultural Foods

Consumption of Belowground Produce

$$EVR = \frac{CVR \times AVC \times WP \times RF_{oral} \times FHP}{BW}$$

Where:

- EVR = daily exposure from belowground vegetables (ug/kg/day)
- CVR = total plant concentration as a result of root uptake (ug/g fresh weight)
- AVC = amount of root vegetables consumed per day (g/day)
- RF_{oral} = relative bioavailability of compound (%)
- FHP = fraction of vegetation that is from home garden (%)
- BW = receptor body weight (kg)
- WP = washing and food preparation factor (15% reduction, U.S. EPA OSW 1998; 100 - 15 = 85% or 0.85).

$$EVR = 8.7E-10 = \frac{3.8E-10 \times 188 \times 0.85 \times 100\% \times 100\%}{70.9}$$

Consumption of Aboveground Leafy Vegetables

$$EVL = \frac{CVL \times AVL \times WP \times RF_{oral} \times FHP}{BW}$$

Where:

- EVL = daily exposure from aboveground leafy vegetables (ug/kg/day)
- CVL = total plant concentration (ug/g fresh weight)
- AVL = amount of leafy vegetables consumed per day (g/day)
- RF_{oral} = relative oral bioavailability of compound (%)
- FHP = fraction of vegetation that is from home garden (%)
- BW = receptor body weight (kg)
- WP = washing and food preparation factor (15% reduction, U.S. EPA OSW 1998; 100 - 15 = 85% or 0.85)

$$EVR = 6.3E-07 = \frac{3.8E-07 \times 137 \times 0.85 \times 100\% \times 100\%}{70.9}$$

Consumption of Fruit/Berries

$$EVF = \frac{CVF \times AVF \times WP \times RF_{oral} \times FHP}{BW}$$

Where:

- EVF = daily exposure from fruits (ug/kg/day)
- CVF = total fruit concentration (ug/g fresh weight)
- AVF = amount of fruit consumed per day (g/day)
- RF_{oral} = relative oral bioavailability of compound (%)
- FHP = fraction of fruit that is from impacted site (%)
- BW = receptor body weight (kg)

WP = washing and food perpetration factor (0% reduction for fruits; U.S. EPA OSW 1998; 100 - 0 = 100% or 1.0).

$$EVF = 2.5E-07 = \frac{3.8E-07 \times 46 \times 100\% \times 100\%}{70.9}$$

Total Home-grown Produce Exposure

$$EVT = EVL + EVF + EVR$$

Where:

EVT = total exposure from fruits and vegetables (ug/kg/day)

$$EVT = 8.8E-07$$

Calculation of Human Exposure via Consumption of Game or Fish Tissue

The chemical exposure from consumption of game is shown below (moose is used as an example)

$$Exp_{tissue} = \frac{C_{tissue} \times R_{tissue} \times BIO_{oral}}{BW}$$

Where:

- Exp_{tissue} = receptor's daily exposure to chemical (ug/kg/day)
- C_{tissue} = chemical concentration in tissue (ug/g fresh weight)
- R_{tissue} = amount game tissue consumed (g/day)
- BIO_{oral} = relative oral bioavailability of the compound (%)
- BW = receptors body weight (kg)

$$Exp_{tissue} = 1.1E-06 = \frac{3.8 \times 10^{-7} \times 205 \times 100\%}{70.9}$$

3.2 Estimation of Exposure from Air

Direct Air Inhalation

Direct Air Inhalation Exposure on Outdoor Days:

$$AirInh_{outdoor} = \frac{AIAct \times RF_{inh} \times c_{air} \times (rSAS + rSAW)}{BW \times DPY}$$

Where:

- $AirInh_{outdoor}$ = inhalation exposure from chemicals in the air during outdoor days (ug/kg/day)
- $AIAct$ = amount of air inhaled on outdoor days (m^3/day)
- c_{air} = site air concentration (ug/m^3)
- RF_{Inh} = relative inhalation bioavailability of the compound (%)
- $rSAS$ = outdoor summer days spent (days/year)
- $rSAW$ = outdoor winter days spent (days/year)
- BW = receptor body weight (kg)
- DPY = days per year (365 days/year)

$$AirInh_{outdoor} = 0.033 = \frac{15.8 \times 100\% \times 0.299 \times (106.46 + 76.04)}{70.9 \times 365}$$

Inhalation Exposure Calculations on Indoor Days

$$AirInh_{indoor} = \frac{AIPass \times RF_{inh} \times c_{air} \times (rSPS + rSPW) \times Inf}{BW \times DPY}$$

Where:

- $AirInh_{indoor}$ = inhalation exposure from chemicals in the air during indoor day (ug/kg/day)
- $AIPass$ = amount of air inhaled on indoor days (m^3/day)
- RF_{Inh} = relative inhalation bioavailability of the compound (1; unitless)
- c_{air} = site air concentration (ug/m^3)
- $rSPS$ = indoor summer days spent (days)
- $rSPW$ = indoor winter days spent (days)
- Inf = fraction of indoor air that is from outdoor air (1)
- BW = receptor body weight (kg)
- DPY = days per year (365 days/year)

$$AirInh_{indoor} = 0.033 = \frac{15.8 \times 100\% \times 100\% \times 0.299 \times (106.46 + 76.04) \times 1}{70.9 \times 365}$$

Exposure via Direct Air Inhalation

$$Air_{Total} = AirInh_{indoor} + AirInh_{outdoor}$$

Where:

- Air_{Total} = total inhalation exposure from chemical as vapour in air (ug/kg/day)
- $AirInh_{outdoor}$ = inhalation exposure from chemicals in the air during outdoor days (ug/kg/day)

$AirInh_{indoor}$ = inhalation exposure from chemicals in the air during indoor day
 (ug/kg/day)

$$Air_{Total} = 0.066$$

3.3 Calculation of Exposure from Soil/Dust

Assumptions Defining Dust Levels Generated by Soils

- Background outside dust levels: 42 ug/m³ (MOEE 1994)
- Percent of dust produced from soil: 50% (Hawley 1985)
- Percent of outside dust level indoors: 75% (Roberts *et al.* 1974)

Sample calculation concerning the level of dust generated from soil alone (i.e., background levels), suspended in air:

- Outside: 42 ug/m³ x 0.50 / 1,000,000 ug/g = 2.1E-05 g/m³
- Indoors: 42 ug/m³ x 0.50 x 0.75 / 1,000,000 ug/g = 1.57E-05 g/m³

The exposure contributions from chemically impacted soil were considered for three routes of exposure: i) inhalation of re-suspended dusts, ii) incidental ingestion of soil, and iii) dermal contact with skin.

Inhalation Exposure from Dust on Outdoor Summer Days

Contribution from Outside Airborne Dust:

$$EXP_{SIAO} = \frac{AI \times SL \times RF_{inh} \times SODL \times Fd \times SOD}{BW \times DPY}$$

Where:

- EXP_{SIAO} = inhalation exposure to chemical from summer outside airborne dust (ug/kg/day)
- AI = amount of air inhaled (m³/day)
- SL = concentration of chemical in untilled surficial soil (ug/g)
- RF_{inh} = relative inhalation bioavailability (1; unitless)
- SODL = background dust level in outside air (g/m³)
- Fd = Fraction of outdoor dust attributable to outdoor soil (50%)
- SOD = number of summer days spent outside per year (days/year)
- BW = receptor body weight (kg)
- DPY = days per year (365 days/year)

$EXP_{SIAO} = 3.4E-09 = \frac{15.8 \times 2.5E-03 \times 100\% \times 2.1 \times 10^{-5} \times 106.46}{70.9 \times 365}$

Contribution from Indoor Airborne Dust on Summer Days:

$$EXP_{SIAI} = \frac{AI \times SL \times RF_{inh} \times SIDL \times SID}{BW \times DPY}$$

Where:

- EXP_{SIAI} = summer inhalation exposure to chemical from summer indoor airborne dust (ug/kg/day)
 AI = amount of air inhaled (m³/day)
 SL = concentration of chemical in soil (ug/g)
 RF_{inh} = relative inhalation bioavailability (1; unitless)
 SIDL = background dust level in indoor air (g/m³)
 Fd = fraction of outdoor dusts attributable to outdoor soil
 SID = number of summer days spent indoors (days/year)
 BW = receptor body weight (kg)
 DPY = days per year (365 days/year)

$$EXP_{SIAI} = 3.4E-09 = \frac{15.8 \times 0.0025 \times 100\% \times 2.1 \times 10^{-5} \times 106.46}{70.9 \times 365}$$

Inhalation Exposure from Dust on Outdoor Winter Days

It was assumed that 10% of the summer outside dust level was available during the winter months.

Contribution from Outside Airborne Dust:

$$EXP_{WIAO} = \frac{AI \times SL \times RF_{inh} \times WODL \times PWS \times WOD}{BW \times DPY}$$

Where:

- EXP_{WIAO} = winter inhalation exposure from outside airborne dust (ug/kg/day)
 AI = amount of air inhaled (m³/day)
 SL = concentration of chemical in soil (ug/g)
 RF_{inh} = relative inhalation bioavailability (1; unitless)
 WODL = background dust level in outside air (g/m³)
 PWS = percentage of winter soil available (10%)
 Fd = fraction of outdoor dusts attributable to outdoor soil
 WOD = number of winter days spent outside per year (days/years)
 BW = receptor body weight (kg)
 DPY = days per year (365 days/year)

$$EXP_{WIAO} = 2.4E-10 = \frac{15.8 \times 0.0025 \times 100\% \times 2.1 \times 10^{-5} \times 10\% \times 76.04}{70.9 \times 365}$$

Contribution from Indoor Airborne Dust on Winter Days:

$$EXP_{WIAI} = \frac{AI \times SL \times RF_{inh} \times WIDL \times PWS \times WID}{BW \times DPY}$$

Where:

- EXP_{WIAI} = winter inhalation exposure to chemical from indoor airborne dust (ug/kg/day)
- AI = amount of air inhaled (m³/day)
- SL = concentration of chemical in soil (ug/g)
- RF_{inh} = relative inhalation bioavailability (1; unitless)
- WIDL = background dust level in indoor air (g/m³)
- PWS = percentage of winter soil available (10%)
- Fd = fraction of outdoor dust attributable to outdoor soils (50%)
- WID = number of winter days spent indoors (days/year)
- BW = receptor body weight (kg)
- DPY = days per year (365 days/year)

$$EXP_{WIAI} = 2.4E-10 = \frac{15.8 \times 0.0025 \times 100\% \times 2.1 \times 10^{-5} \times 10\% \times 76.04}{70.9 \times 365}$$

Total Exposure (inhalation of vapour and dusts):

$$EXP_{INH} = EXP_{SIAO} + EXP_{SIAI} + EXP_{WIAO} + EXP_{WIAIA} + Air_{Total}$$

Where:

- EXP_{INH} = total inhalation exposure (ug/kg/day)
- EXP_{SIAO} = summer inhalation exposure to chemical from outside airborne dust (ug/kg/day)
- EXP_{SIAI} = summer inhalation exposure to chemical from indoor airborne dust (ug/kg/day)
- EXP_{WIAO} = winter inhalation exposure to chemical from outside airborne dust (ug/kg/day)
- EXP_{WIAIA} = winter inhalation exposure to chemical from indoor airborne dust (ug/kg/day)
- Air_{Outdoor} = total inhalation exposure from chemical as vapour in air (ug/kg/day)

$$EXP_{INH} = 0.033$$

Ingestion of Soil/Dusts

The following provides the equations used to calculate exposures via ingestion of soil/dust:

Incidental Outdoor Soil Ingestion during Summer Months

Incidental Outdoor Dust Ingestion during Summer Months

$$EXP_{SGAO} = \frac{AO \times SL \times RF_{oral} \times SOD}{BW \times DPY}$$

Where:

- EXP_{SGAO} = exposure from incidental ingestion of outside soil during summer (ug/kg/day)
- AO = amount of dust ingested (g/day)
- SL = concentration of chemical in soil (ug/g)
- RF_{oral} = relative oral bioavailability (100%; unitless)
- SOD = total number of days spent on the site during the summer (days/year)
- BW = receptor body weight (kg)
- DPY = averaging time (365 days)

$$EXP_{SGAO} = 2.1E-07 = \frac{0.02 \times 0.0025 \times 1 \times 106.46}{70.9 \times 365}$$

Incidental Indoor Dust Ingestion during Summer Months

Contribution from Indoor Dust:

$$EXP_{SGAI} = \frac{AO \times F \times SL \times FR_{out} \times RF_{oral} \times SOD}{BW \times DPY}$$

Where:

- EXP_{SGAI} = exposure from incidental ingestion of indoor dust during summer (ug/kg/day)
- AO = amount of soil/dust ingested (g/day)
- SL = concentration of chemical in soil (ug/g)
- RF_{oral} = relative oral bioavailability (100%; unitless)
- FR_{out} = fraction of dust originating from outdoor soil sources (Assumed 100%)
- SOD = total number of days spent on the site during the summer days/year
- BW = receptor body weight (kg)
- DPY = averaging time (365 days)

$$EXP_{SGAI} = 2.1E-07 = \frac{0.02 \times 0.0025 \times 100\% \times 100\% \times 106.46}{70.9 \times 365}$$

Incidental Outdoor Soil Ingestion during Winter Months

Contribution from Outside Soil:

$$EXP_{WGAO} = \frac{AO \times F \times SL \times WDF \times F_{oral} \times WOD}{BW \times DPY}$$

Where:

- EXP_{WGAO} = exposure from incidental ingestion soil in winter (ug/kg/day)
- AO = amount of dust ingested (g/day)
- SL = concentration of chemical in soil (ug/g)
- RF_{oral} = relative oral bioavailability (1; unitless)
- WOD = total number of days spent on the site during the winter (days/year)
- WDF = winter soil/dust covering factor (0.10)
- BW = receptor body weight (kg)
- DPY = averaging time (365 days)

$$EXP_{WGAO} = 1.5E-08 = \frac{0.02 \times 0.0025 \times 0.10 \times 100\% \times 76.04}{70.9 \times 365}$$

Incidental Indoor Dust Ingestion during Winter Months

Contribution from Indoor Dust:

$$EXP_{WGAI} = \frac{AO \times SL \times WDF \times RF_{oral} \times WOD}{BW \times DPY}$$

Where:

- EXP_{WGAI} = exposure from incidental ingestion of indoor dust during winter (ug/kg/day)
- AO = amount of soil/dust ingested (g/day)
- SL = concentration of chemical in dust (ug/g)
- RF_{oral} = relative oral bioavailability (1; unitless)
- WOD = total number of days spent on the site (indoors and outdoors) during the winter months (days/year)
- WDF = winter dust covering factor (10%)
- BW = receptor body weight (kg)
- DPY = averaging time (365 days)

$$EXP_{WGAI} = 1.5E-08 = \frac{0.02 \times 0.0025 \times 10\% \times 100\% \times 76.04}{70.9 \times 365}$$

Total Exposure via Incidental Ingestion:

$$EXP_{ING} = EXP_{SGAO} + EXP_{WGAO} + EXP_{SGAI} + EXP_{WGAI}$$

Where:

- EXP_{ING} = total oral exposure from incidental ingestion of indoor soil/dust ug/kg/day)
- EXP_{SGAO} = oral exposure from incidental ingestion of summer outside dust/soil (ug/kg/day)
- EXP_{WGAO} = oral exposure from incidental ingestion of outside dust/soil in winter (ug/kg/day)
- EXP_{SGAI} = oral exposure from incidental ingestion of inside dust during the summer (ug/kg/day)
- EXP_{WGAI} = oral exposure from incidental ingestion of inside dust during winter (ug/kg/day)

$$EXP_{ING} = 4.5E-07$$

Dermal Contact with Soil/Dust

Dermal Exposure from Soil/Dust on Outdoor Summer Days

Contribution from Outside Soil/Dust:

$$EXP_{SDAO} = \frac{[(AS_s \times DAF_B) + (AH \times DAF_H)] \times SL \times AF_{Dermal} \times SOD}{BW \times DPY}$$

Where:

- EXP_{SDAO} = dermal exposure to chemical from contact with outside soil/dust in summer (ug/kg/day)
- AS_s = area of exposed skin when outside (m²)
- DAF_B = soil/dust adherence factor (g/m²)
- AH = area of exposed hands (m²)
- DAF_H = soil adherence factor hands only (g/m²/event)
- SL = concentration of chemical in soil (ug/g)
- AF_{Dermal} = relative dermal bioavailability (unitless)
- SOD = number of summer days spent outdoors (days/year)
- BW = receptor body weight (kg)
- DPY = days per year (365 days/year)

$$EXP_{SDAO} = 1.2E-06 = \frac{[(0.419 - 0.083) \times 0.1] + (0.083 \times 1)] \times 0.0025 \times 100\% \times 106.46}{70.9 \times 365}$$

Contributions from Indoor Soil/Dust:

$$EXP_{SDPI} = \frac{[(AS_s \times DAF_B) + (AH \times DAF_H)] \times SL \times AF_{Dermal} \times SID}{BW \times DPY}$$

Where:

- EXP_{SDPI} = dermal exposure to chemical from contact with indoor soil/dust in summer (ug/kg/day)
- AS_s = area of exposed skin when indoors (m²)
- DAF_B = soil/dust adherence factor (g/m²)
- AH = area of exposed hands (m²)
- DAF_H = soil adherence factor hands only (g/m²/event)
- SL = concentration of chemical in soil (ug/g)
- AF_{Dermal} = relative dermal bioavailability (unitless)
- SID = number of days spent indoors (days/year)
- BW = receptor body weight (kg)
- DPY = days per year (365 days/year)
- 0.70 = fraction of dust originating from outdoor soil sources (U.S. EPA 1994a)

$$EXP_{SDPI} = 1.2E-06 = \frac{[(0.419 - 0.083) \times 0.1 + (0.083 \times 1)] \times 0.0025 \times 100\% \times 100\% \times 106.46}{70.9 \times 365}$$

Dermal Exposure from Soil/Dust on Outdoor Winter Days

Contribution from Outside Soil/Dust:

$$EXP_{WDAO} = \frac{[(AS_w \times DAF_B) + (AH \times DAF_H)] \times SL \times PWS \times AF_{Dermal} \times WOD}{BW \times DPY}$$

Where:

- EXP_{WDAO} = dermal exposure to chemical from contact with outside soil/dust in winter (ug/kg/day)
- AS_w = area of exposed skin when outdoors (m²)
- DAF_B = soil/dust adherence factor (g/m²)
- AH = area of exposed hands (m²)
- DAF_H = soil adherence factor hands only (g/m²/event)
- SL = concentration of chemical in soil (ug/g)
- PWS = percentage of winter soil available (10%)
- AF_{Dermal} = relative dermal bioavailability (unitless)
- WOD = number of winter days spent outdoors (days/year)
- BW = receptor body weight (kg)
- DPY = days per year (365 days/year)

$$EXP_{WDAO} = 6.7E-08 = \frac{[(0.168 - 0.083) \times 0.1 + (0.083 \times 1)] \times 0.0025 \times 10\% \times 76.04}{70.9 \times 365}$$

Contribution from Indoor Soil/Dust:

$$EXP_{WDPI} = \frac{[(AS_w \times DAF_B) + (AH \times DAF_H)] \times SL \times PWS \times AF_{Dermal} \times WID}{BW \times DPY}$$

Where:

- EXP_{WDPI} = dermal exposure to chemical from contact with indoor soil/dust in winter (ug/kg/day)
- AS_w = area of exposed skin when indoors (m²)
- DAF_B = soil/dust adherence factor (g/m²)
- AH = area of exposed hands (m²)
- DAF_H = soil adherence factor hands only (g/m² event)
- SL = concentration of chemical in soil (ug/g)
- PWS = percentage of winter soil available (10%)
- 0.70 = fraction of dust originating from outdoor soil sources (U.S. EPA 1994a)
- AF_{dermal} = fraction of chemical absorbed by receptor by dermal contact with soil/dust (unitless)
- WID = number of days spent indoors on site (days/year)
- BW = receptor body weight (kg)
- DPY = days per year (365 days/year)

$EXP_{WDPI} = 6.7E-08 = \frac{[(0.168 - 0.083) \times 0.1 + (0.083 \times 1)] \times 0.0025 \times 0.10 \times 1 \times 1 \times 76.04}{70.9 \times 365}$

Total Exposure (dermal)

$$EXP_{DERM} = EXP_{SDAO} + EXP_{SDPI} + EXP_{WDAO} + EXP_{WDPI}$$

Where:

- EXP_{DERM} = total dermal exposure to chemical from contact with outside/dust (ug/kg/day)
- EXP_{SDAO} = dermal exposure to chemical from contact with summer outside soil/dust (ug/kg/day)
- EXP_{SDPI} = dermal exposure to chemical from contact with summer indoor soil/dust (ug/kg/day)
- EXP_{WDAO} = dermal exposure to chemical from contact with winter outside soil/dust (ug/kg/day)
- EXP_{WDPI} = dermal exposure to chemical from contact with winter indoor soil/dust (ug/kg/day)

EXP_{DERM} = 2.5E-06

4 RISK CHARACTERIZATION

4.1 Human Risk Characterization

Total exposure was calculated by summing the individual exposures from each media (air, soil, game and vegetation) for all relevant exposure pathways on a chemical and receptor basis. Risk estimates or threshold and non-threshold COPCs were estimated using the equations provided below and the calculated exposure estimates.

Both non-cancer and cancer risks were estimated and presented for appropriate oral, dermal and inhalation exposures.

4.2 Calculating Risks for Non-Carcinogens

Oral risks were estimated based on the following equation.

$$RQ = \frac{E_{ORAL} \times RAF}{EL_{ORAL}}$$

Where:

- RQ = risk quotient (unitless)
- E_{Oral} = total daily oral exposure from all pathways (ug/kg/day)
- RAF = relative absorption factor (80%)
- EL_{Oral} = chemical-specific oral exposure limit (ug/kg/day)

$$RQ_{oral} = 2.2E-06 = \frac{0.00022 \times 100\%}{100}$$

Dermal risks were estimated based on the following equation.

$$RQ = \frac{E_{DERMAL} \times RAF}{EL_{ORAL}}$$

Where:

- RQ = risk quotient (unitless)
- E_{Dermal} = total daily dermal exposure from all pathways (ug/kg/day)
- RAF = relative absorption factor (0.13 / 0.8 = 0.1625 or 16.25%)
- EL_{Oral} = chemical-specific oral exposure limit (ug/kg/day)

$$RQ_{dermal} = 2.5E-08 = \frac{2.5E-6 \times 100\%}{100}$$

Inhalation risks were calculated based on the following equation.

$$RQ = \frac{EI_{Inhalation} \times RAF}{EL_{Inhalation}}$$

Where:

- RQ = risk quotient (unitless)
- $EI_{Inhalation}$ = total daily inhalation exposure from all pathways (ug/kg/day)
- RAF = relative absorption factor (1.0 / 1.0 = 1.0 or 100%)
- $EL_{Inhalation}$ = chemical-specific inhalation exposure limit (ug/kg/day)

$$RQ_{inh} = 0.00033 = \frac{0.033 \times 100\%}{100}$$

Total risk quotient values for all assessed pathways were calculated based on the following equation:

$$RQ_{tot} = RQ_{oral} + RQ_{der} + RQ_{inh}$$

$$RQ_{tot} = 0.00033$$

Calculating Risks for Carcinogens

As discussed in the main report, differentiation between lifetime cancer risks (LCR) and incremental lifetime cancer risks (ILCR) has been made in the risk assessment. LCR values describe the estimated number of cancers per 100,000 people to which exposure to the COPC may contribute. There is no acceptable 'benchmark' for LCR, and LCR is evaluated in cases where background exposures are included (eg. Background, baseline, application and CEA cases).

In contrast, ILCR values were calculated for the Project alone (determined by subtracting the baseline LCR from the application LCR), and were compared to the acceptable level of risk of 1 new case per 100,000 people. Thus, the key differences between LCR and ILCR are: whether or not background exposures are included, evaluation of the project alone, and one represents an incidence rate while the other represents the number of cancer cases per 100,000 attributable to the Project.

Carcinogenic risks from oral and dermal exposures (although not for naphthalene) were calculated based on the following equation:

$$LCR = EXP_{Oral+Dermal} \times AMT \times q_1^*$$

Where:

- LCR = Number of estimated cancer cases per 100,000 population associated with exposure to the COPC

$EXP_{Oral+Dermal}^*$ = total daily exposure *via* oral and dermal pathways (ug/kg/day)
 q_1^* = chemical-specific cancer slope factor for oral (ug/kg bw/day)⁻¹
AMT = receptor specific amortization factor (years exposed / life expectancy (75 years))

Similarly,

$$ILCR = EXP_{Oral+Dermal} \times AMT \times q_1^*$$

Carcinogenic risks from inhalation exposures were calculated based on the following equation:

$$LCR = EXP_{inhal} \times AMT \times q_1^*$$

Where:

ILCR = incremental lifetime cancer risk
 EXP_{inhal}^* = total daily exposure *via* inhalation (ug/kg/day)
 q_1^* = chemical-specific cancer slope factor for inhalation (ug/kg bw/day)⁻¹
AMT = receptor specific amortization factor (years exposed / life expectancy (75 years))

Similarly,

$$ILCR = EXP_{inhal} \times AMT \times q_1^*$$

5 MODIFICATIONS OF EXPOSURE ESTIMATES BASED ON RELATIVE BIOAVAILABILITY

One of the most important factors in determining exposure of target tissues to chemicals is bioavailability, or the proportion of a chemical dose entering the blood stream (i.e., absorbed dose) following administration via a particular route (i.e., oral, inhalation or dermal). Systemic absorption of chemicals can differ according to whether the dose was received via the dermal, oral or the inhalation route. Also, the systemic absorption will differ depending on whether the exposure occurs in water, in soil, in food, etc.

It is not considered appropriate to convert exposure estimates to absorbed doses if toxicity values (from recognized agencies) are based on administered doses. However, if an exposure estimate is adjusted for bioavailability and is expressed as an absorbed dose, then it must be compared to an exposure limit that is based on an absorbed dose, not administered dose. Since most exposure limits are based on administered doses, it may not always be appropriate to consider absolute bioavailability (fraction or percentage of an external dose which reaches the systemic circulation) during the assessment of exposure. Therefore relative bioavailability may be determined by comparing the extent of absorption among several routes of exposure, forms of the same chemical, or exposure medium (food, soil, or water).

As a specific example, it is often necessary to consider route-to-route extrapolation when an exposure limit is not available for the exposure route of concern and no other data (such as pharmacokinetics) are available. It is common to assess the risks posed by dermal absorption of a chemical based on the exposure limit established for oral exposure. The systemic dose *via* dermal absorption is scaled to the 'equivalent' oral dose by correcting for the bioavailability of dermally-applied chemical relative to an orally-administered dose.

Toxicity information used to derive exposure limits is usually based on the administered dose, the absorbed dose or the internal dose. Incorporating bioavailability is dependant on which form the chemical was introduced to the test organism or toxicity study. For the most part, toxicity studies are based on the chemical given orally in food or water. In addition, these studies will use a form of chemical that is highly bioavailable to promote the most efficient toxic effect to the test organism at a given concentration. For example, in studies involving metal toxicity, the compound is often administered as a very soluble salt in water or food. Differences in the adsorption of chemicals between laboratory organisms and wildlife as well as between different mediums of exposure will invariably exist. The relative absorption factor (RAF) is the variable used to incorporate bioavailability information to exposure assessment (Menzie et al. 2000).

The RAF is used to adjust the absorption of a chemical from an exposure medium to that of the absorption of the chemical used in the toxicity study. The following equation was used to calculate the RAF:

$$RAF = \frac{BA_M}{BA_{EL}}$$

Where:

- RAF = relative adsorption factor (unitless)
- BAM = absorption of the chemical form in the exposure medium (%)
- BAEL = absorption of the chemical form in the study medium (%)

An RAF can be less than or greater than one. An RAF of one does not indicate that the bioavailability is 100%, but the estimated bioavailability for the chemical in the exposure medium is the same as that used in the toxicity study for developing the toxicity reference value (TRV). In circumstances where the bioavailability is unknown for a particular medium, it is acceptable to conservatively default to an RAF of one. In this case, there is no adjustment of the exposure route relative to the toxicity study. [Table 5-1](#) provides the bioavailability adjustments that were applied in the HHRA.

Table 5-1 Bioavailability (BA) Adjustments (%)

Chemical	Type	Inhalation (BA)	Oral (BA)	Dermal (BA)
PAHs				
Anthracene	Route	100	76	13
	Study	100	76	76
Benz(a)anthracene	Route	100	31	13
	Study	100	31	31

6 CANCER RISKS FOR RECEPTORS EXPOSED TO CHEMICALS FROM THE SITE FOR THEIR ENTIRE LIFETIME

The level of risk for the composite receptor was calculated by adding the adjusted exposure ratio (ER) values calculated for each individual life stage (adjusted for duration of exposure) in order to estimate the lifetime cancer risk. The compilation of all five individual life stages (infant, 0.5/75; toddler, 4.5/75; child, 7/75; youth/adolescent, 8/75; adult, 56/75) results in a risk estimate for the composite receptor over a 75-year lifetime.
