Regarding: Assessment of 8 Alberta Waterbodies – Alberta Environment and Parks

Dear Mr. Douglas:

Please find enclosed the summary report for the water quality and bathymetry assessment of 8 Alberta waterbodies, as outlined in contract number 16OIN889.

If you have any questions or require further information, please contact our office at your convenience.

Sincerely,
RC BioSolutions Ltd.

1. Introduction

The objective of the project was to gather sufficient data within each of the eight water bodies to allow Alberta Environment and Parks to determine if each water body has appropriate habitat (depth and water quality) to support stocked fish throughout the year. The recorded information will also determine which fish species would be best suited for stocking based on habitat conditions. The eight lakes that were assessed included Dolberg Lake, Salter's Lake, Muir Lake, Cardiff Park Pond, Black Nugget Mine Pit Lake, Dillberry Lake, Blood Indian Creek Reservoir, and Tyrell Lake (Figure 1).

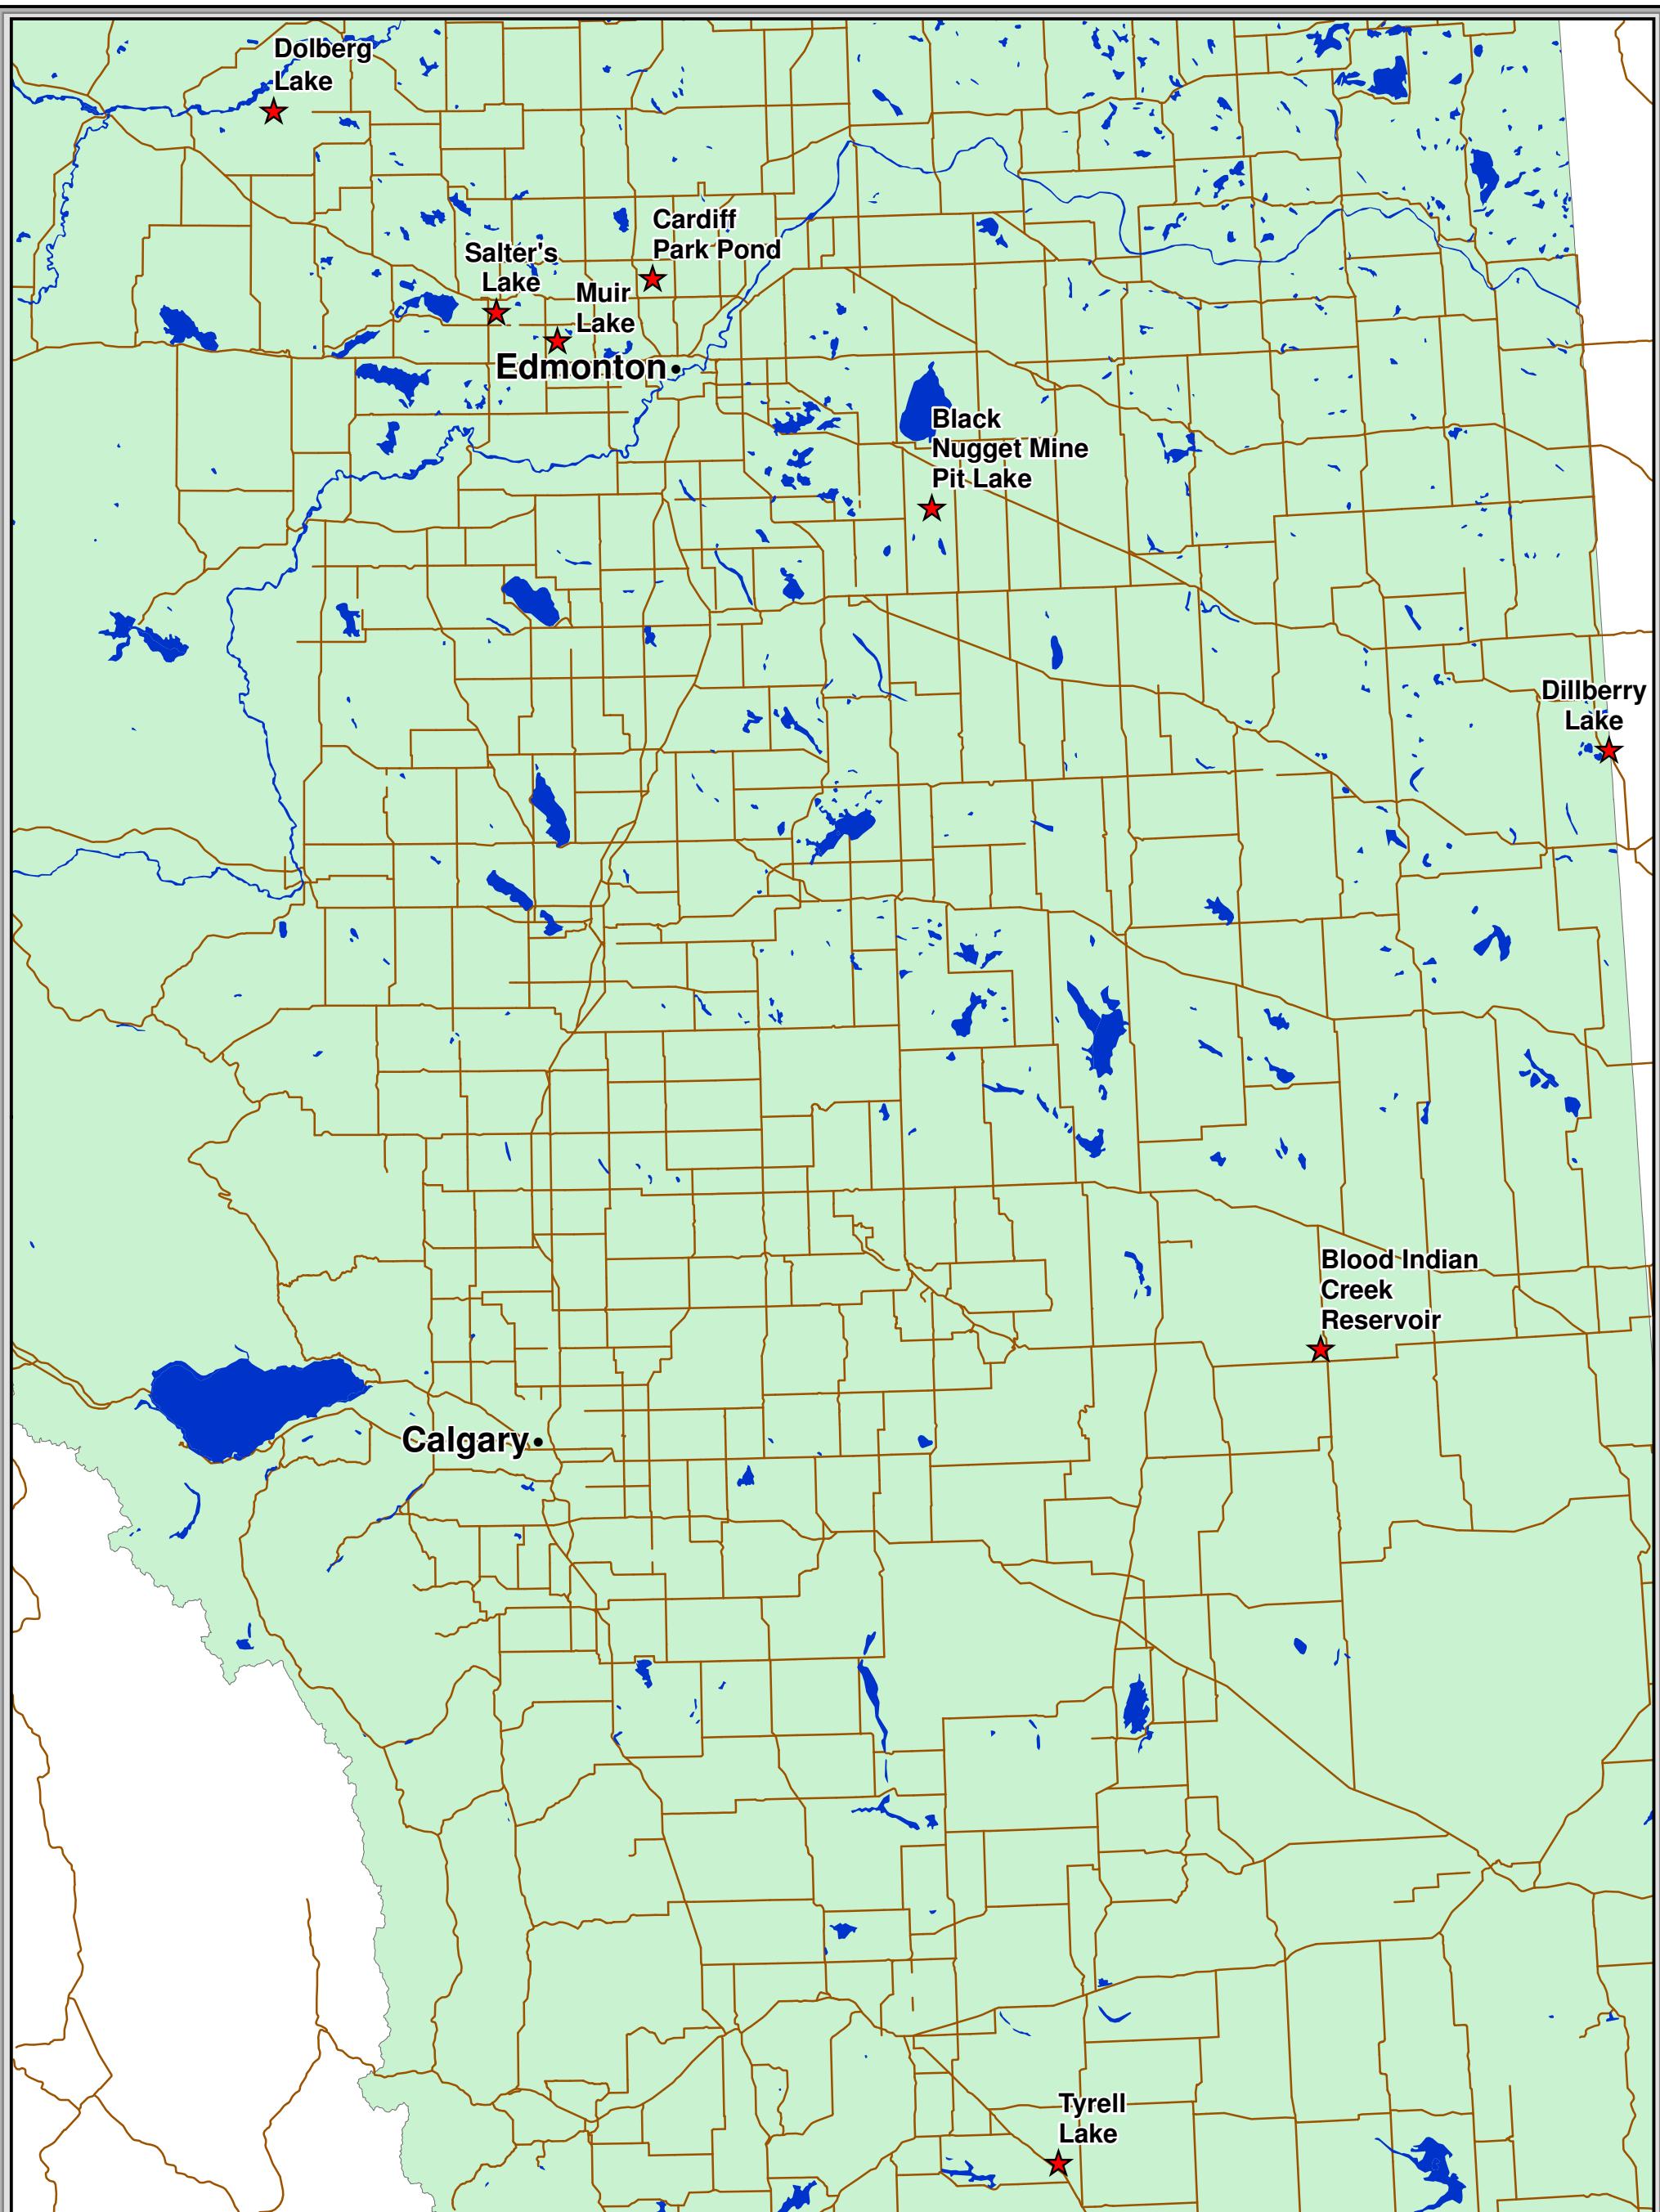

To achieve the project objective, a bathymetry survey and several water quality profiles at different seasons throughout the year were completed for each lake.

The following staff were involved in the project:

Richard Carson – project manager and field crew lead.

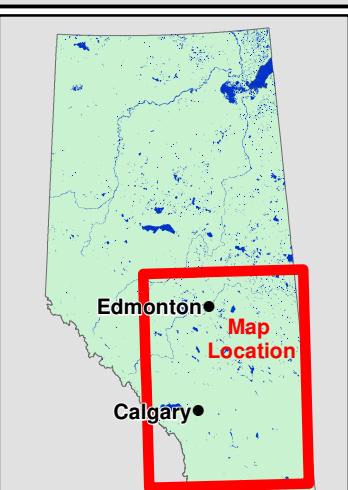

Sandra Babiuk – field crew member and alternate field lead.

Matthew Landgrebe – field crew member.

* Site not sampled on February 9, 2016 due to poor ice conditions limiting access.

2.2 Bathymetry

All data gathered during the open water season was collected from a Zodiac inflatable boat propelled by a gas powered outboard motor, while data gathered during winter sampling was collected from the top of the ice using a gas powered auger to drill through the ice. The use of a gas powered motor is permitted for all work being done by the province. All bathymetry data was collected with a boat-mounted Lowrance 5DS HD sounding unit. A correction was made to account for the distance below water surface at which the transducer was mounted prior to each bathymetry survey. The sounding unit contained a built-in GPS that allows for logging of horizontal position and water depth. Depth measurements were collected every 2 to 3 m of horizontal travel depending on boat speed. The GPS was used in non-differential mode; with an estimated horizontal accuracy of ± 5 to 10 m. Depth points were collected by navigating a 12 ft. inflatable boat with an approximate 25 m wide grid pattern. Depths as shallow as 1 m were traversed. For large waterbodies (i.e. Tyrell Lake), a wider grid pattern was used for some portions of the lake that had little contour change.

Prior to sounding each lake, the sounder was calibrated using a weighted line to measure the actual water depth and compared to the sounder reading. Adjustments to the transducer angle were made to ensure accurate readings.

A lake surface elevation was taken using a sub cm Spectrum Precision SP80 GPS survey instrument so that the collected bathymetry data is tied to the actual water surface elevation.

A bathymetry map was generated within ArcGIS for each waterbody. The map includes the water quality sample station locations.

2.3 Water Quality Profiles

In-situ water quality profiles were measured at each lake, four times during the year with the first set of water quality profiles collected concurrently with the bathymetry surveys. Measurements were taken at a minimum of three stations per lake with one sample station located at the deepest part of the lake. For larger lakes (Tyrell Lake and Blood Indian Creek Reservoir), additional stations were measured to get a representative sample of the entire lake.

Physical parameters (DO, temperature, pH, and specific conductivity) were measured using an YSI Professional Plus multimeter. Salinity was calculated from temperature and specific conductivity in practical salinity units (psu).

UTM coordinates (NAD 83) at each profile location was recorded along with site photographs and depth to bottom. Measurements were recorded at the surface and at 1 m or 0.5 m intervals with the final measurement taken at bottom. In winter, the first measurement was taken under the ice at the ice/water interface.

All data was recorded on standard preprinted forms containing the WQ station number and location, parameter measurement, and corresponding depth.

Calibration of the multimeter was completed and documented before each sampling period.

3. Results

3.1 Dolberg Lake

Tables 2 to 4 contain the complete water quality profile data for each sample station. Figures 2 to 4 summarize the dissolved oxygen profiles and Figures 5 to 7 summarize the temperature profiles. Most profiles in July, August, and February exhibit a typical stratified water column pattern, while the October profile exhibits a typical fall turnover, fully mixed water column pattern.

Bathymetry data was collected on July 30, 2015 and was used to create a lake bathymetry map (Figure 8). Figures 9 and 10 are site photographs taken during the sampling.

Table 2. Dolberg Lake water quality profile summary at station DOL1.

BioSolutions Ltd. Figure No. 8

Figure 9. Dolberg Lake (August) – looking north from station DOL1.

Figure 10. Dolberg Lake (February) – sampling at station DOL1.

3.2 Salter's Lake

Tables 5 to 7 contain the complete water quality profile data for each sample station. Figures 11 to 13 summarize the dissolved oxygen profiles and Figures 14 to 16 summarize the temperature profiles. Most profiles in July, August, and February exhibit a typical stratified water column pattern, while the October profile exhibits a typical fall turnover, fully mixed water column pattern.

Bathymetry data was collected on July 29, 2015 and was used to create a lake bathymetry map (Figure 17). Figures 18 and 19 are site photographs taken during the sampling.

Figure 27. Muir Lake (August) – looking north from station MUIR1.

Figure 28. Muir Lake (February) – sampling at station MUIR3.

3.4 Cardiff Park Pond

Tables 11 to 13 contain the complete water quality profile data for each sample station. Figures 29 to 31 summarize the dissolved oxygen profiles and Figures 32 to 34 summarize the temperature profiles. Most profiles in July, August, and February exhibit a typical stratified water column pattern, while the October profile exhibits a typical fall turnover, fully mixed water column pattern.

Bathymetry data was collected on July 27, 2015 and was used to create a lake bathymetry map (Figure 35). Figures 36 to 37 are site photographs taken during the sampling.

Figure 36. Cardiff Park Pond (August) – looking north from station CAR01.

Figure 37. Cardiff Park Pond (February) – sampling at station CAR01.

3.5 Black Nugget Mine Pit Lake

Tables 14 to 16 contain the complete water quality profile data for each sample station. Figures 38 to 40 summarize the dissolved oxygen profiles and Figures 41 to 43 summarize the temperature profiles. Most profiles in July, August, and February exhibit a typical stratified water column pattern, while the October profile exhibits a typical fall turnover, fully mixed water column pattern.

Bathymetry data was collected on July 28, 2015 and was used to create a lake bathymetry map (Figure 44). Figures 45 and 46 are site photographs taken during the sampling.

Figure 46. Black Nugget Mine Pit Lake (October) – sampling with YSI meter from Zodiac.

3.6 Dillberry Lake

Tables 17 to 19 contain the complete water quality profile data for each sample station. Figures 47 to 49 summarize the dissolved oxygen profiles and Figures 50 to 52 summarize the temperature profiles. Most profiles in July, August, and February exhibit a typical stratified water column pattern, while the October profile exhibits a typical fall turnover, fully mixed water column pattern.

Bathymetry data was collected on July 28, 2015 and was used to create a lake bathymetry map (Figure 53). Figures 54 and 55 are site photographs taken during the sampling.

Figure 65. Blood Indian Creek Reservoir (August) – looking north from station BL01.

Figure 66. Blood Indian Creek Reservoir (February) – sampling from top of ice.

3.8 Tyrell Lake

Tables 24 to 28 contain the complete water quality profile data for each sample station. Figures 67 to 71 summarize the dissolved oxygen profiles and Figures 72 to 76 summarize the temperature profiles. Most profiles in July, August, and February exhibit a typical stratified water column pattern, while the October profile exhibits a typical fall turnover, fully mixed water column pattern.

Bathymetry data was collected on August 1, 2015 and was used to create a lake bathymetry map (Figure 77). Figures 78 and 79 are site photographs taken during the sampling.
