

Alberta Public Affairs Bureau Omnibus Survey

Field Dates:

November 18 to 28, 2003

Methodology

Research Methodology

SURVEY METHOD

The results of the survey are based on a probability sample of 1000 adults living in Alberta. The survey was conducted by telephone from November 18 to 28, 2003.

SAMPLE SELECTION

The sampling method was designed to complete 1000 interviews within households randomly selected across the province of Alberta. The sample was drawn in proportion to the populations of 12 urban centers and 3 rural regions within the province based on information from Statistics Canada 2001 Census Data. (See page entitled "Sampling Methodology" for a detailed breakdown of surveys by geographic location)

From within each multi-person household contacted, respondents 18 years of age and older were screened for random selection using the "Most Recent Birthday" method. The use of this technique produces results that are as valid and effective as enumerating all persons within a household and selecting one randomly.

TELEPHONE INTERVIEWING & QUALITY CONTROL

Field supervisors were present at all times to ensure accurate interviewing and recording of responses. A minimum of 10 percent of each interviewer's work was unobtrusively monitored for quality control in accordance with the standards set out by the Canadian Association of Marketing Research Organizations.

A minimum of five calls were made to a household before classifying it as a "no answer."

Research Methodology

STATISTICAL RELIABILITY OF DATA

A sample of 1000 persons within the population produces results which are reliable to within plus or minus 3.0%, 19 times in 20. A simple example which illustrates this point is that if we surveyed 1000 people within the population, and we ended up with 50% of respondents giving a particular response, we can be reasonably confident (95%) that the actual proportion of people in the total population with that opinion will be between 47% and 53% (plus or minus 3%).

It is important to remember that when results are analyzed by geographic region, the margin of error becomes larger due to smaller respondent bases. For instance, there were approximately 250 people surveyed in Calgary, so consequently the margin of error for Calgary data will be larger than for the total respondent base of 1000. The table to the right provides an indication of the relative margin of error expected for various sample sizes.

Sample Size	Margin of Error (95% Confidence Level)
25	19.6%
50	13.9%
100	9.8%
200	6.9%
250	6.2%
300	5.7%
500	4.4%
1000	3.1%
2000	2.2%

STATISTICAL SIGNIFICANCE OF DATA

Whenever results within subgroups of respondents are compared - either to other subgroups of respondents or to the total average - it is important to remember that not all differences are statistically significant.

Some results might be higher or lower than the average score, but depending on the respondent base for that group, the results might only be directional and not statistically significant. The table to the right indicates the minimum difference required to be

statistically significant when comparing results from the six geographic regions that were surveyed.

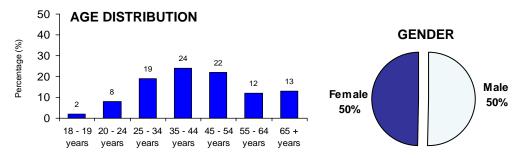

Significance testing is included in the data tables. Results are compared against the total, and a negative sign (-) is produced if a result is significantly lower, while a plus sign (+) is shown if it's significantly higher. One symbol (- or +) indicates significance to the 90% confidence level, while results with two symbols (-- or ++) are to the 95% confidence level.
